## TABLE OF CONTENTS

ITEM	SECTION
Cover Sheet	
Table of Contents	
Response Letter	1
Revised Summary of Results	2
Revised Time of Concentration and SCS Curve Number Calculations, Example of CN & DCIA Generation (Tables 4.1, 4.2, 5.1, 5.2)	3
Revised Hydrograph Summaries (Tables 6.1, 6.2, 6.3 and 6.4)	4
Revised Retention Pond Sizing and Data, Revised Nodal Diagrams (Figures 7.1 and 7.2)	5
Revised Runoff Routing Results (Tables 8.1, 8.2, 8.3 and 8.4)	6
Revised Pollution Abatement Calculations and P.A.V. and Total Drawdown Modret Package (Table 9.1)	7

## ENCLOSURES

- A. Pre-development Basin Map (Revised), Phases 2 and 3
- B. Offsite Drainage Basin Map (Revised, Phase 1)
- C. Post-development Basin Map (Revised), Phases 2 and 3

## ATTACHED SEPARATELY

Revised Final Engineering Plans, Sheets 1-15/15.

**SECTION 1**

June 14, 1994

Ms. Margie Cook, P.E.  
St. Johns River Water Management District  
618 E. South Street, Suite 200  
Orlando, Florida 32801

Re: Greater Pines, Phases 2 and 3  
St. Johns River Water Management District Application No. 4-069-0276AM  
CPH Job No. G6765.04

Dear Ms. Cook:

In response to the Water Management District's request for additional information on the permit application, attached please find three sets of revised Engineering Plans, drainage plans, and calculations. These revised plans and calculations, together with the following specific responses address the questions of your request letter.

The following specific responses are provided:

- 1A. We have reviewed on the USGS topographic maps those areas north of Phase 2 and west of Phase 1 and concur that there may be some additional area tributary to the proposed drainage systems. We have revised our calculations and drainage mapping to include the additional area north of Phase 2 and west of Phase 1 (Basins D-off and 203, respectively for the pre- and post-development cases) that may contribute runoff to the project's site. We have revised both the pre-development and the post-development mapping and calculations to address this additional data.
- 1B. The hydrograph parameters used for Phase 1 in these calculations were taken from the exhibits and calculations submitted to the District for approval on Phase 1. Two of the Phase 1 basins shown were Basin 100 (which became Basin K of this submittal) and Basin 200 (which became Basin J in this submittal.) For these two, the areas and TC's were as shown on the Phase 1 post-development drainage map. The CN's were broken down into the % DCIA and the CN of the pervious and NDCIA for this submittal. Basin 300 of the Phase 1 submittal was further broken down into Basins A, H, and I, for this submittal. The hydrograph generating data used appears consistent with the Phase 1 submittals.
- 1C. We have reviewed the topographic survey and the USGS topo off-site regarding pre-development Basin B depressional storage. Please be advised that the specific site topography was calculated out to the east edge of Hancock Road and not beyond. The methods of preparing the topography (the shooting of spot elevation shots input in to a computer digital terrain modeling program and generation of a site topo), resulted in showing - erroneously - that the contours immediately east of Hancock Road at that location, in fact, close. Please review the USGS topography supplied and you will see that this basin continues to fall to the east, and that there is not a closed depression of any magnitude at that location. Thus, we feel that the volumes used for Basin B, in our pre-development calculations, and the overflow elevation for Basin B at 161 - being the low place in the road - appear reasonable. We have revised both the pre-development and post-development topography to delete that portion of the topo which is erroneous.

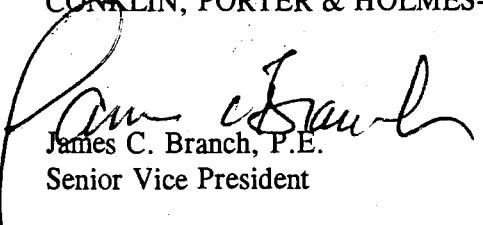

Ms. Margie Cook, P.E.  
June 14, 1994  
Page 2

- 1D. The post-development impervious areas were calculated using house areas, driveway areas, sidewalk areas, etc. A portion of the house, the entire driveway and sidewalk, as well as the total of the roadway, was used as impervious directly-connected area. The remainder of the house, roof, does not flow to the road, but instead onto pervious area. This remainder was used to calculate a weighted NDCIA curve number. A sketch showing how the DCIA, NDCIA, pervious areas, and curve numbers were determined is attached.
- 1E. Post-development Basin 106 was inadvertently left out of the analysis; the revised calculations attached include Basin 106.
- 1F. We have revised the retention ponds within the site to include deepening and widening Pond No. 2. The revised plans and stage storage calculations reflect this revised volume.
2. Modret calculations, indicating that the ponds will recover their storage capacity within 14 days, as well as percolate the revised pollution abatement volumes, are attached. Also attached is a copy of soils borings information used for determination of the Modret parameters.
- 3A. We have revised the Engineering Plans and calculations to show a temporary pond (Pond 4) to be constructed, to capture the runoff from Basins 314 and 315. Revised plans and calculations are attached.
- 3B. Please note that the limits of Phase 2 have been appreciably changed on this set of revised plans. There are two very small areas which would flow out of Phase 2 into a future Phase 3 area. This runoff will flow downhill through Phase 3 area into Pond 2.
4. Attached is a copy of the preliminary plat submitted to, and approved by, Lake County for the overall Greater Pines development. We have added an easement on the Engineering Plans for the collection system between Lots 30 and 31.
5. It is proposed that the operation entity will be Lake County and a specific Letter of Acceptance of the drainage system from Lake County will be provided prior to the operations portion of the permit.

Please review the attached information and if you have any other questions, please call.

Sincerely,

CONKLIN, PORTER & HOLMES-ENGINEERS, INC.

  
James C. Branch, P.E.

## NOTES:

- a) L1-G, S1-G & T1-G ARE LENGTH, SLOPE AND COMPUTED TIME OF TRAVEL FOR RUNOFF OVER GRASS IN 1ST 300 FT, USING SHEET FLOW FORMULAE FROM SCS TR55.
- b) L1-C, S1-C & T1-C ARE LENGTH, SLOPE AND COMPUTED TIME OF TRAVEL FOR RUNOFF OVER PAVED IN 1ST 300 FT, USING SHEET FLOW FORMULAE FROM SCS TR55.
- c) L2-G & T2-G ARE LENGTH AND COMPUTED TIME OF TRAVEL FOR RUNOFF OVER GRASS IN REMAINING PATH LENGTH @ 30 FPM.
- d) L2-C & T2-C ARE LENGTH AND COMPUTED TIME OF TRAVEL FOR RUNOFF OVER PAVED IN REMAINING PATH LENGTH @ 120 FPM.
- e) TRAVEL TIME (Tt) IS THE SUM OF TIME FOR FIRST 300 FT PLUS TIME FOR REMAINING PATH OR 10 MINUTE MINIMUM PER FDOT.

$$T1-C\&G = \{0.007(nL)^{0.8}\} / \{(P)^{0.5}(s)^{0.4}\}$$

Where:

T = Time (hrs)  
 L = Length (ft)  
 s = slope (ft/ft)  
 P = 2yr - 24hr Rainfall (in)  
 n = Manning's roughness coefficient

## Assumptions:

n = 0.011 for concrete  
 n = 0.15 for grass  
 P = 4.8 in.

NOTES:

1. DCIA = DIRECTLY CONNECTED IMPERVIOUS AREA, i.e. IMPERVIOUS AREA DIRECTLY CONNECTED TO THE STORM DRAINAGE SYSTEM WITHOUT FLOW OVER ANY PERVERIOUS AREA.
2. NDCIA = IMPERVIOUS AREA NOT DIRECTLY CONNECTED TO THE STORM SYSTEM, BUT WHICH DISCHARGES OVER A PERVERIOUS AREA PRIOR TO ENTRY INTO THE STORM DRAINAGE SYSTEM.
3. AREA OF IMPERVIOUS = DCIA + NDCIA.
4. PERCENT DCIA COMPUTED BY DIVIDING AREA DCIA BY THE TOTAL BASIN AREA.
5. SCS "CN" FOR PERVERIOUS AND NDCIA COMPUTED BY DIVIDING THE SUM OF THE PRODUCTS OF THE PERVERIOUS AREA TIMES IT'S CN AND THE NDCIA AREA TIMES IT'S CN, BY THE SUM OF THE SAME TWO AREAS.
6. PERVERIOUS AREA CN FOR BASINS H.I.J.& K USED WAS 39, NOT 48 AS USED FOR THE WHOLELY UNDEVELOPED BASINS.

NOTES:

1. DCIA = DIRECTLY CONNECTED IMPERVIOUS AREA,  
i.e. IMPERVIOUS AREA DIRECTLY CONNECTED TO THE  
STORM DRAINAGE SYSTEM WITHOUT FLOW OVER  
ANY PVIOUS AREA.
2. NDCIA = IMPERVIOUS AREA NOT DIRECTLY CONNECTED  
TO THE STORM SYSTEM, BUT WHICH DISCHARGES OVER  
A PVIOUS AREA PRIOR TO ENTRY INTO THE STORM  
DRAINAGE SYSTEM.
3. AREA OF IMPERVIOUS = DCIA + NDCIA.
4. PERCENT DCIA COMPUTED BY DIVIDING AREA DCIA  
BY THE TOTAL BASIN AREA.
5. SCS "CN" FOR PVIOUS AND NDCIA COMPUTED BY  
DIVIDING THE SUM OF THE PRODUCTS OF THE PVIOUS  
AREA TIMES A CN OF 39 AND THE NDCIA AREA TIMES A  
CN OF 95, BY THE SUM OF THE SAME TWO AREAS.

NOTES:

1. AREA OF IMPERVIOUS = DCIA + NDCIA.
2. REQUIRED VOLUME FOR ON-LINE PONDS IS THE GREATER OF:
  - a) 0.5 INCH RUNOFF OVER THE ENTIRE AREA, OR
  - b) 1.25 INCHES RUNOFF OVER THE IMPERVIOUS AREA,  
BOTH, PLUS 0.5 INCH OVER THE ENTIRE AREA.

### ADDITIONAL DRAWDOWN MODELING DATA:

1. PERMEABILITY - FROM THE SEEPAGE ANALYSIS FOR GREATER PINES PHASE I (PN 92-501.22) AN AVE. COEFFICIENT OF PERMEABILITY OF 28 FPD WAS REPORTED FROM SOIL BORINGS. THIS VALUE WAS ASSUMED FOR BOTH VERTICAL & HORIZONTAL PERMEABILITIES FOR THIS ANALYSIS.
2. "CONFINING LAYER" - NO CONFINING LAYER WAS ENCOUNTERED IN BORINGS. WILL ASSUME FOR MODEL THAT THE CONFINING LAYER IS 16 FT BELOW POND BOTTOM.
3. GROUNDWATER TABLE - NO GWT WAS ENCOUNTERED FROM BORINGS. WILL ASSUME FOR MODEL THAT GWT IS 2.0 FT ABOVE CONFINING LAYER ELEV.
4. EFFECTIVE SOIL STORAGE COEF. - WILL CONSERVATIVELY ESTIMATE TO BE 0.20

## 1.0 SUMMARY

This modification consists of the addition of Phases 2 & 3 to the already permitted Phase 1 of Greater Pines subdivision. Greater Pines is a 303 acre, 572 single family unit subdivision in south Lake County, on Hancock Road, south of U.S. 50. Phase 1 was previously permitted by the SJRWMD under permit # 4-069-0276.

The attached calculations and exhibits detail the pre- and post-development stormwater drainage conditions for the 2nd and 3rd phases of the Greater Pines Development in southern Lake County. These two phases consist of approximately 119 acres at the south end of the Greater Pines Development. Figure 1.1 is a site location map shown on the USGS topographic base, showing the location of these three phases relative to the overall site, and the overall site location relative to adjacent points of interest. The development proposed under this permit consists of the construction of approximately 200 single-family homes and the roadways and storm drainage facilities to serve them. These are the second and third phases of a 6-phase project.

Two storm events were analyzed. The first was a 25-year frequency, 24-hour. 8.3 inch storm for which pre-post rate determinations have been analyzed. The second event was a 25-year, 96-hour storm event analyzed to establish the pre and post volumes of runoff arriving at the project boundaries. This was done because such an analysis was required by the District for Phase 1.

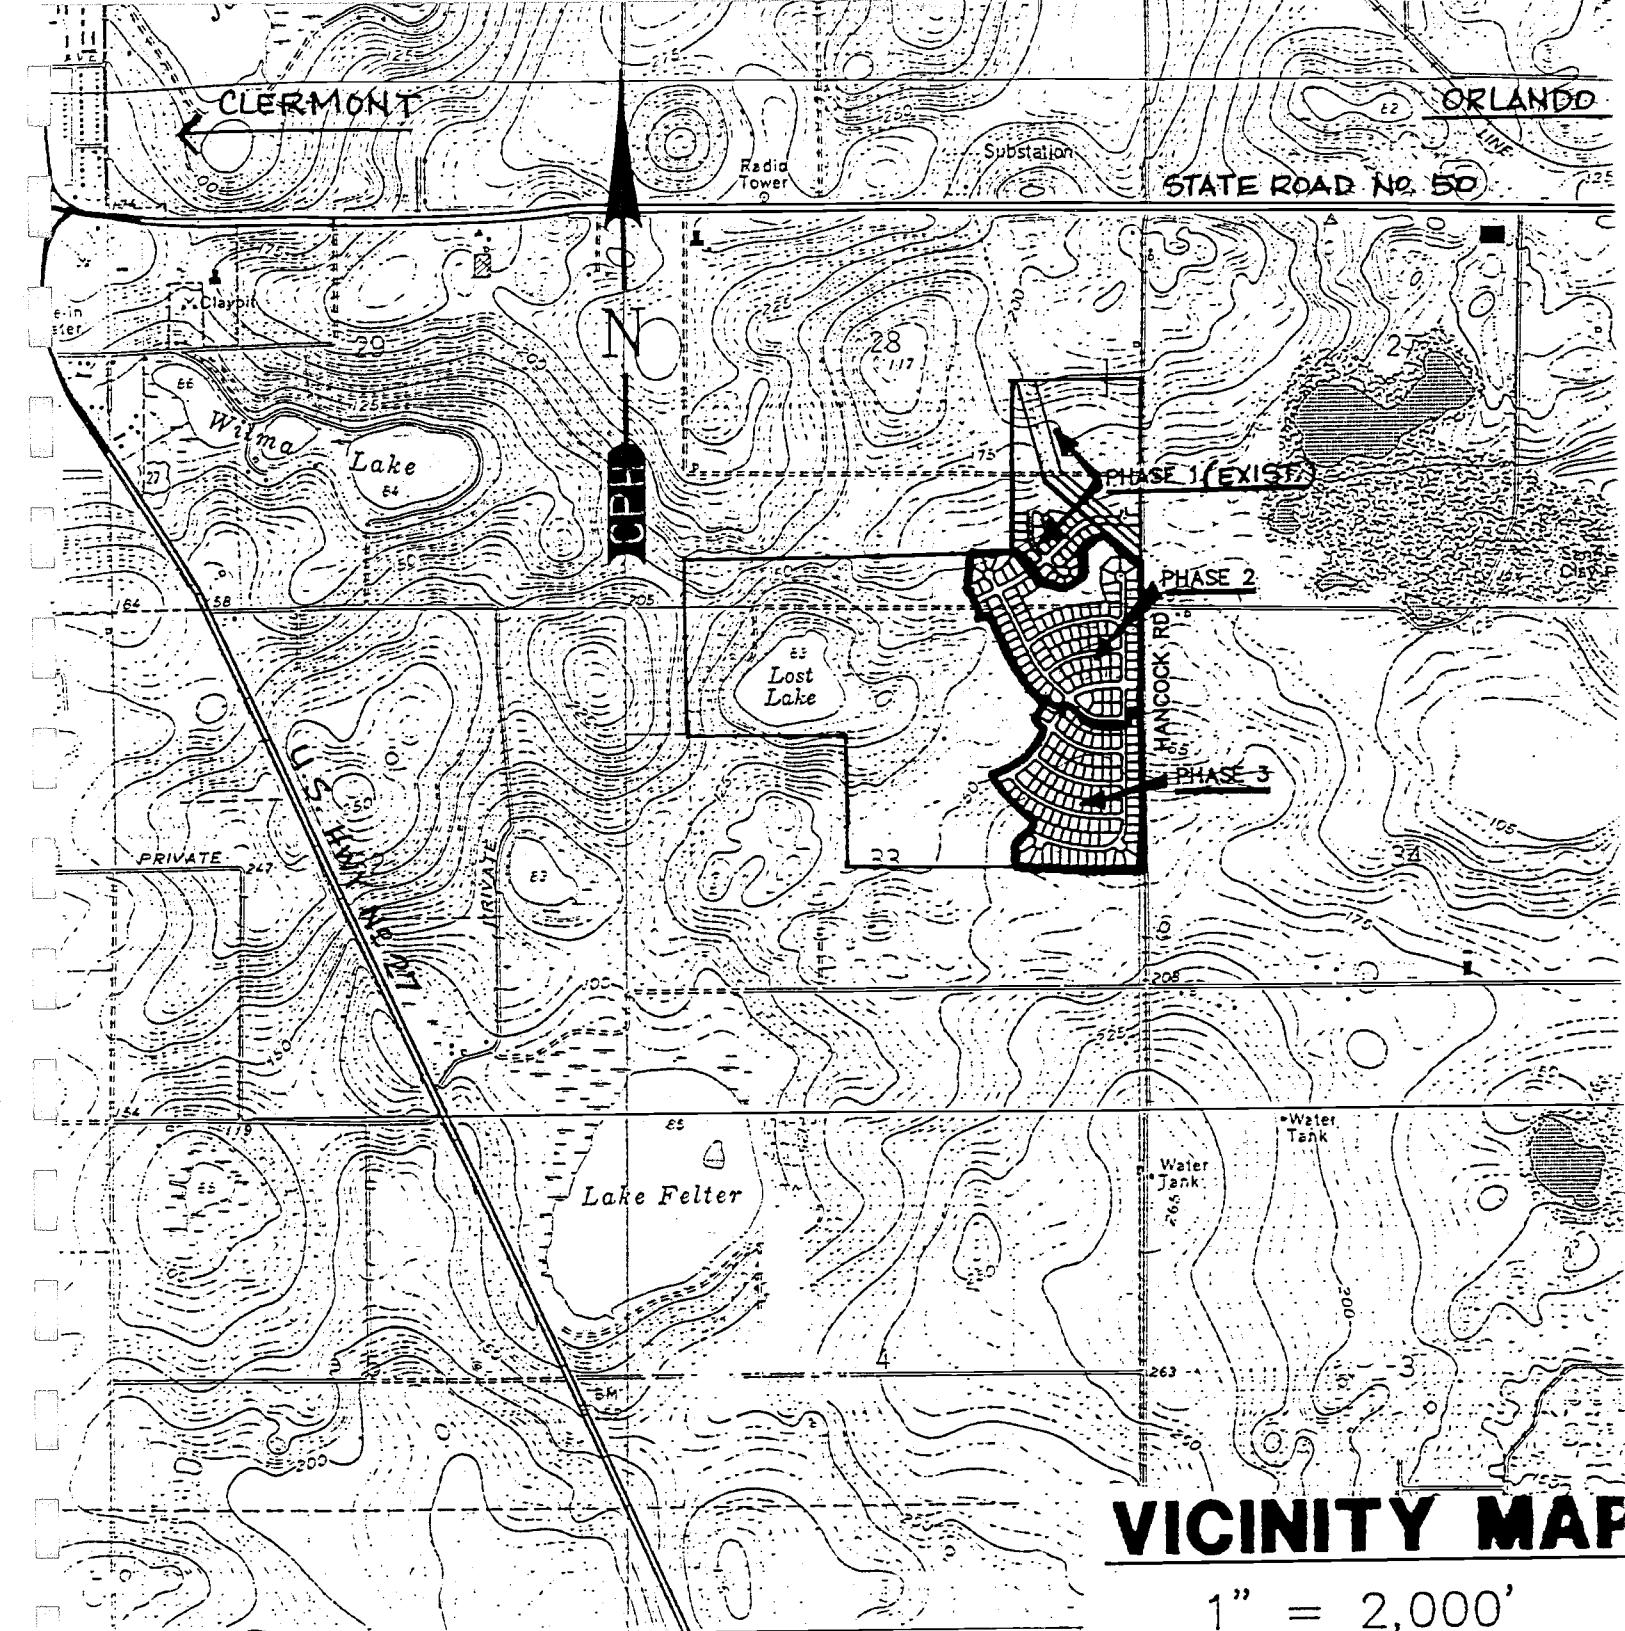

The analysis indicated two measurement points for comparison of pre and post development runoff rates and volumes. The first was offsite to the east across Hancock Road - onto properties owned by others. This drainage path is labelled "OFFEAST" in the calculations. The second was offsite to the west onto other future phases of this development, on to land owned by the applicant. This drainage path is labelled "OFFWEST" in the calculations.

Table 1.1 (attached) summarizes the results of the calculations. As can be seen from Table 1.1, runoff in the postdevelopment condition is less in rate for the 25-year, 24-hour event and in

volume for the 25-year, 96-hour event than the corresponding predevelopment runoff for each of the measurement points.

Pollution abatement volumes have been provided within the proposed retention ponds in sufficient volume to meet the Water Management District criteria for on-line retention ponds. Volume calculations and drawdown analyses (Modret) are presented.

There are no wetlands within Phases 2 & 3 of this project.

SUMMARY OF RESULTS

GREATER PINES PHASES 2 & 3  
CPH Job No. G6765.04

ITEM	PREDEVELOPED CONDITION	POSTDEVELOPED CONDITION
I.) 25 Year Frequency/24-Hour Duration Event		
A) Runoff rate offsite to the East (OFFEAST)	18.8 CFS	0.0 CFS
B) Runoff rate offsite to the West (OFFWEST)	49.8 CFS	2.3 CFS
II.) 25 Year Frequency/96-Hour Duration Event		
A) Runoff volume offsite to the East (OFFEAST)	8.1 ACFT	0.0 ACFT
B) Runoff volume offsite to the West (OFFWEST)	23.7 ACFT	22.7 ACFT

## **2.0 SITE DATA**

### **2.1 Site Description and Location**

Phases 2 & 3 of Greater Pines consists of an approximate 119 acre area on which 200 single-family homes and the appurtenant streets, water system and stormwater system are to be built. These phases are part of an overall 303 acre, approximately 600 home development. The first phase of the development has been constructed; these are the next two proposed phases. The developed first phase of Greater Pines is tributary in both the pre and post developed conditions to a common pond area with Phase 2 & 3.

### **2.2 Project Description**

The purpose of this analysis is to demonstrate that the amount of stormwater retention provided in the development condition is sufficient to attenuate the peak runoff rates postdevelopment for the site to equal or be less than the predevelopment case, and also to provide retention as necessary to reduce the runoff volume postdevelopment to be less than or equal to the predevelopment runoff for the 25-year, 96-hour event. Moreover, pollution abatement volume has been provided within the proposed retention ponds to meet that portion of the Water Management District criteria.

## **3.0 ANALYSIS METHODOLOGY**

### **3.1 Site Topography, Soils and Cover**

The site topography and soils for both the predevelopment and post development conditions may be seen on the attached enclosures labeled "A", "B" and "C". Site cover was determined from observation prior to development and consisted of vacant land where previously orange groves had been frozen out, as well as a planted pine grove. The site is now grown up with brush. Most of the orange trees are dead and are to be totally removed as part of this construction. The predeveloped and postdeveloped conditions presented herein uses Greater Pines Phase 1 in a developed state -- it's present condition.

### **3.2 Time of Concentration Determinations**

Time of concentration for the development has been determined by breaking the site into topographic basins, determining flow paths lengths, distance of overland flow, etc. to determine, on a basin by basin basis, the time of concentration. The time of concentration for the first 300' of path length was determined by the methodology shown in the SCS TR-55 publication for sheet flow (see pages 33 and 34 of SCS TR-55), and the remainder of the path lengths was evaluated for time of concentration using flow rates of 30' per minute over grass conditions and 120' per minute over pavement.

### **3.3 SCS Curve Number Generation**

Soils Conservation Service curve numbers were generated for each of the predevelopment and postdevelopment basins using methodology presented in SCS publication TR-55, as well as the National Engineering Handbook #4 from that same organization. The impervious areas were estimated using 1/2 of the house area, the sidewalk and 1/2 of the pavement in front of each unit as directly connected impervious (DCIA) and the remaining 1/2 of the house area as non-directly connected impervious (NDCIA); except in basins where the roadway predominated.

### **3.4 Predevelopment Hydrograph Generation**

Predevelopment hydrographs were generated for the 25-year frequency 24-hour duration storm of approximately 8.3 inches and the 25-year frequency 96-hour duration storm of approximately

11.9 inches using SCS hydrograph methods with a peaking factor of 484 for the undeveloped basin and the Santa Barbara Urban Hydrographs method for the developed basins. Rainfall distributions used were Type III for the 25-year 24-hour event, and the rainfall distribution published by the Water Management District for the 25-year 96-hour event.

### **3.5 Predevelopment Retention Ponds & Routing**

The predevelopment hydrographs (including hydrographs for the completed Phase 1 development) were routed through the natural depressions shown on the predevelopment basin map and, for Phase 1 basins, through the ponds created for Phase 1 to determine the predevelopment routed runoff.

### **3.6 Postdevelopment Retention Ponds**

Three retention ponds are proposed to serve Phases 2 & 3. The first is an enlargement of the SE and SW ponds previously permitted in Phase 1 and takes the place of those ponds. The second and third ponds are proposed to be temporary ponds, to be replaced when subsequent phases of Greater Pines are permitted and built. Plans for each of these basins were used to determine their stage storage relationships; outfall parameters for each of ponds were determined to rate the outflow from each pond and be able to route the runoff through that pond.

### **3.7 Postdevelopment Hydrograph Generation**

Hydrographs for the postdevelopment condition were generated using the Santa Barbara Urban Hydrograph Method with SCS curve numbers and times of concentration as discussed above. A Type III rainfall distribution was assumed for the 25-year 24-hour event and the St. Johns River Water Management District distribution was used for the 25-year 96-hour event.

### **3.8 Postdevelopment Routing**

Hydrographs generated for the postdevelopment condition were routed through the proposed retention ponds and outfall systems through the use of the Advanced Interconnected Pond Routing model published by Singhofen. This routing model uses the storage indicating method as its basis, as well as evaluates the effect of tail water conditions. The discharge from Phase 1 into the enlarged retention pond, common to Phases 1, 2 & 3, was included in these calculations.

### **3.9 Pollution Abatement**

The retention pond and rear lot swale areas were evaluated to ensure that they would capture and percolate the required pollution abatement volume required by the Water Management District for on-line pond systems. This amount calculated as required retention is the larger of  $\frac{1}{2}$  inch over the whole site area or  $1 \frac{1}{4}$ " over the impervious area, both plus  $\frac{1}{2}$ " over the whole site area in as much as on-line ponds are proposed. In the case of the first pond proposed (Pond 1) under this permit, it was evaluated for both the pollution abatement volume for its direct tributary area from portions of Phase 1, as well as the tributary areas from Phases 2 & 3.

## **4.0 SITE TIME OF CONCENTRATION DETERMINATION**

### **4.1 Predevelopment**

Predevelopment time of concentrations for each of the basins were calculated by the methodology described in Section 3.0 and are presented in Table 4.1.

### **4.2 Postdevelopment**

Postdevelopment time of concentration for each of the postdevelopment basins calculated per Section 3.0 may be seen on Table 4.2. The notes in that table further describe the calculation parameters used for the time of concentration determinations.

## NOTE:

- a) L1-G, S1-G & T1-G ARE LENGTH, SLOPE AND COMPUTED TIME OF TRAVEL FOR RUNOFF OVER GRASS IN 1ST 300 FT, USING SHEET FLOW FORMULAE FROM SCS TR55.
- b) L1-C, S1-C & T1-C ARE LENGTH, SLOPE AND COMPUTED TIME OF TRAVEL FOR RUNOFF OVER PAVED IN 1ST 300 FT, USING SHEET FLOW FORMULAE FROM SCS TR55.
- c) L2-G & T2-G ARE LENGTH AND COMPUTED TIME OF TRAVEL FOR RUNOFF OVER GRASS IN REMAINING PATH LENGTH @ 30 FPM.
- d) L2-C & T2-C ARE LENGTH AND COMPUTED TIME OF TRAVEL FOR RUNOFF OVER PAVED IN REMAINING PATH LENGTH @ 120 FPM.
- e) TRAVEL TIME (Tt) IS THE SUM OF TIME FOR FIRST 300 FT PLUS TIME FOR REMAINING PATH OR 10 MINUTE MINIMUM PER FDOT.

TABLE 4.2

## **5.0 SITE CURVE NUMBER GENERATION**

### **5.1 Predevelopment**

Predevelopment Soils Conservation Service curve numbers were determined from the site soils and observed cover and the use of Table 2-2C of SCS TR55; assuming a cover of brush in poor condition. Thus, a CN of 48 for the predevelopment condition on the undeveloped basin was used, except for that portion of Hancock Road which drains into the site. For the road, a CN of 95 was used for the 18' of asphalt. To be consistent with the postdevelopment curve number generation, a CN of 39 for the pervious portions of the developed basin in Phase 1 was used, as well as 95 for the impervious portions. Table 5.1 shows the predevelopment CN's computed.

### **5.2 Postdevelopment**

Postdevelopment site SCS curve numbers may be evaluated from the attached Table 5.2. In both the predevelopment and postdevelopment cases, curve numbers were determined using the soils shown on the attached, postdevelopment drainage maps, as well as the TR-55 guidelines as to the curve numbers specific to the type of cover on that soil.

TABLE 5.2

## **6.0 SITE HYDROGRAPH GENERATION**

### **6.1 Predevelopment**

Predevelopment hydrographs for each of the predevelopment basins were generated using the methodology indicated in Section 3.0. In addition to the pre-development runoff from Phases 2 & 3, the pre-development condition pond system has tributary to the post-development flows from the present permitted Phase 1. Tables 6.1 and 6.2 present the results of the predevelopment hydrograph generation for the 25/24 and 25/96 events, respectively.

### **6.2 Postdevelopment**

Postdevelopment hydrographs were generated for each of the storm events as indicated under Section 3. Tables 6.3 and 6.4, attached, shows the postdevelopment unrouted runoffs for each of the postdevelopment basins for the 25/24 and 25/96 events, respectively. Note that the post-development hydrographs for the tributary portions of Phase 1 were included as input to proposed pond No. 1.

TABLE 6.4

## **7.0 RETENTION PONDS SIZING AND DATA**

### **7.1 Retention Pond Locations**

The location of each of the retention ponds for Phases 2 & 3 may be seen on the postdevelopment basin maps, as well as on the engineering plans attached. The pre-development case had ponds as shown on the pre-development map; these are to be replaced with new proposed Pond 1.

### **7.2 Pond Parameters**

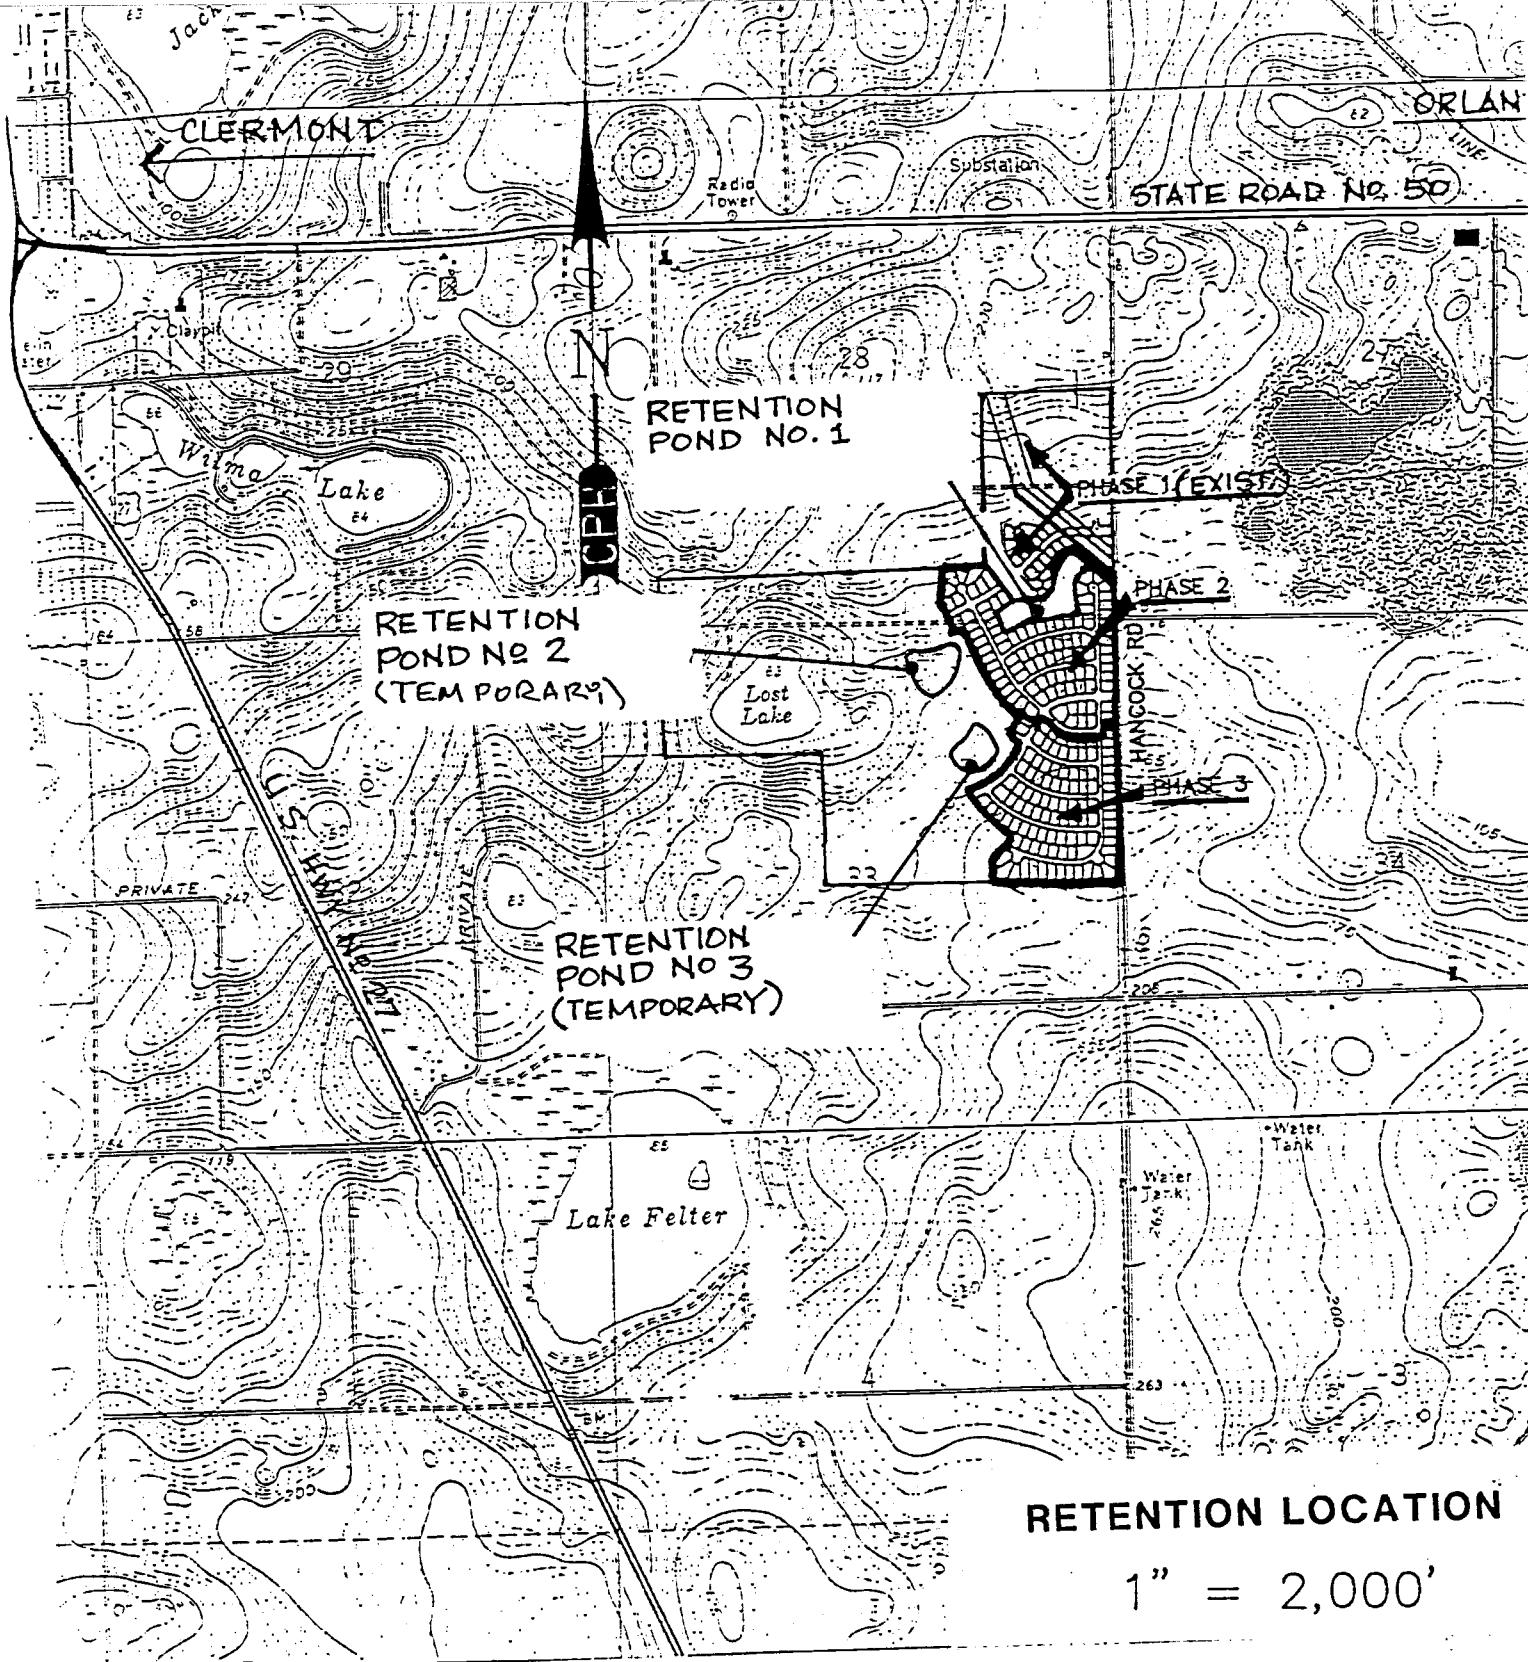

For each of the retention ponds shown on the attached drainage maps, specific calculations were made as to the area and volume of these ponds, and are attached. The pond volumes used for Phase 1 were those from the previously permitted SJRWMD application.

### **7.3 Outfall Parameters**

For each of the retention ponds for Phases 2 & 3 the outfalls were designed and shown on the attached plans. Additionally, stage time relationships for the receiving area off-site were estimated. The receiving area consists of undeveloped upland area to the west of Phases 1, 2 & 3. This undeveloped area falls topographically to the west, eventually discharging into Lost Lake, as shown on the site location map, which shows USGS topo for the site. Stage time relationships for the existing conditions for each of these cases were determined.

### **7.4 Routing Scheme**

Routing schematics (nodal diagrams) showing the interrelationship of the stormwater generation areas, retention basins, and outfalls are attached as Figures 7.1 and 7.2, respectively for the pre- and post-development conditions.

## **8.0 RUNOFF ROUTING, PRE AND POSTDEVELOPMENT**

Postdevelopment unrouted runoff hydrographs were routed through the proposed retention pond system as described in Section 3 for the 25-year 24-hour, and 25-year 96-hour storm events. Tables 8.1 through 8.4 show the nodal maximums for each of these storm events. Additionally, summary table (Table 1.1) compares the results of these postdevelopment routings with the predevelopment routings for each of the pertinent offsite discharge points.

## **9.0 POLLUTION ABATEMENT**

A determination of the volume of pollution abatement was made using the on-line treatment pond criteria shown in St. Johns River Water Management District 40C-42. A soils report done by Michael D. Sims & Associates was used to determine the co-efficient of permeability used within each of the proposed pond areas. This co-efficient of vertical permeability was used to determine draw-down times within the proposed ponds. Table 9.1 summarizes the results of the pollution abatement volume and determinations. Draw-down vs. time calculations for Phases 2 & 3 are attached.

NOTES:

1. AREA OF IMPERVIOUS = DCIA + NDCIA.
2. REQUIRED VOLUME FOR ON-LINE PONDS IS THE GREATER OF:
  - a) 0.5 INCH RUNOFF OVER THE ENTIRE AREA, OR
  - b) 1.25 INCHES RUNOFF OVER THE IMPERVIOUS AREA,  
BOTH, PLUS 0.5 INCH OVER THE ENTIRE AREA.

TABLE 9.1

SUBJECT GREATER PINES PHASES 2 & 3 Div. of Work \_\_\_\_\_  
 Job No. G 6765.04  
 Sheet No. 1 of 1

STAGE OF POND FOR REQUIRED POLLUTION ATTENDEMENT

Pond No. 1

$$\frac{137 - x \text{ (ft)}}{5.973 \text{ (Ac-ft)}} = \frac{137 - 136 \text{ (ft)}}{26.70 - 20.32 \text{ (Ac-ft)}}$$

$$x = 136.06 \text{ ft} = 136.1 \text{ ft} \quad \text{— Ans.}$$

Pond No. 2

$$\frac{119 - x \text{ (ft)}}{1.337 \text{ (Ac-ft)}} = \frac{119 - 118 \text{ (ft)}}{16.34 - 13.42 \text{ (Ac-ft)}}$$

$$x = 118.54 = 118.5 \text{ ft} \quad \text{— Ans.}$$

Pond No. 3

$$\frac{140 - x \text{ (ft)}}{2.60 \text{ (Ac-ft)}} = \frac{140 - 139 \text{ (ft)}}{4.63 - 1.81 \text{ (Ac-ft)}}$$

$$x = 139.08 \text{ ft} = 139.1 \text{ ft} \quad \text{— Ans.}$$

Job No. 66765.04

SUBJECT Greater Pines Phases 2 &amp; 3 MOORET Div. of Work

## A. Equivalent Pond Dimensions:

- Ponds considered as rectangles with dimensions taken @ average depth.

<u>Pond</u>	<u>Length (ft)</u>	<u>Width (ft)</u>
1	1454	160
2	380	188
3	378.5	290

- b. From the Seepage Analysis for Greater Pines Phase I, Lake County, Florida PN 92-501.22, an averaged coefficient of permeability of  $28 \text{ ft/day}$  was determined from soil borings. This value was assumed for both vertical & horizontal directions.
- c. Due to the fact no groundwater was encountered during the boring process a confining layer located 16 ft below pond bottom was assumed. Two feet of groundwater was assumed above the confining layer.
- d. The effective storage coefficient of the soil was assumed to be 0.2.

Job No. 66765.04

SUBJECT G.P. 2+3 MODRET Div. of Work \_\_\_\_\_ Sheet No. 2 of 2

Pond 1:

The pollution abatement volume required (5,977 ac-ft) corresponds to a decrease in stage from 137 ft. to 136.1 ft.

According to the MODRET output for pond 1, this volume of water is infiltrated shortly after 12 hrs. thereby being in compliance with the 72 hr. requirement.

Pond 2:

The pollution abatement volume required (1,337 ac-ft) corresponds to a decrease in stage from 119 ft to 118.5 ft.

According to the MODRET output, this volume infiltrates within 12 hrs.

Pond 3:

The pollution abatement volume required (260 ac-ft) corresponds to a decrease in stage from 140 ft to 139.1 ft

According to MODRET, this volume is infiltrated within 36 hrs.

SUMMARY OF POLLUTION ABATEMENT MODEL RESULTS

POND NAME / No.: POND 3

CUMULATIVE TIME (hrs.)	WATER ELEVATION (feet)	INSTANTANEOUS INFILTRATION RATE (cfs)	AVERAGE INFILTRATION RATE (cfs)
0.000	139.706	0.509 *	0.5925
12.000	139.473	0.676	0.7591
24.000	139.175	0.800	0.8417
36.000	138.843	0.842	0.8427
48.000	138.512	0.809	0.7750
60.000	138.207	0.739	0.7029
72.000	137.930		

\* This value (with associated time) is an equivalent instantaneous infiltration rate to be used with a stormwater routing model (such as ADICPR or others). Just before this time, the infiltration is zero (prior to runoff reaching the pond).

## **10.0 SITE WETLANDS**

There are no wetlands within Phases 2 & 3 - the area proposed for this permit modification, nor in the tributary Phase 1 development.
