Appendix B – Detailed HCS Output

1 Introduction

A Project Development and Environment (PD&E) Study is being initiated for the proposed Wellness Way Toll Road Project. The project is proposed as an east-west roadway connecting US 27 to SR 429. Figure 1 provides a map of the project site location and the proposed alignment. Central Florida Expressway Authority (CFEA) issued a Concept Development and Evaluation Study for a SR 429 to US 27 Connector in January 2007. After evaluation of four prospective corridors, the study recommended the alignment of the proposed project as meeting the study objectives of environmental protection and community building. It should be noted that this study also stated that the majority of trips on the facility would be local in nature and that a toll facility was not warranted.

This current study shows that the facility does warrant tolling and that it not only supports local trips but also longer distance trips from US 27 and SR 50. Some of this is due in part to the inclusion of the Wellness Way Sector Plan and also the recovery of the economy.

The main east-west arterial highways in the study area are SR 50, also referred as Broad Street in Lake County and Colonial Drive in Orange County, and US 192, also referred to as West Irlo Bronson Memorial Highway. It should be noted that the segment of US 192 between US 27 and SR 429 is the boundary between Lake, Orange, Polk and Osceola Counties. The distance along US 27 between US 192 and SR 50 is approximately 15 miles. The only other east-west roadway connecting US 27 and SR 429 is Hartwood Marsh Road, which is approximately three miles south of SR 50. The project, as proposed, will be approximately six miles south of SR 50. The project falls under the Lake-Sumter Metropolitan Planning Organization for the segment in Lake County. Figure 1 shows the project study area.

The general objective of this Design Traffic Technical Memorandum is to provide documented information necessary to assist in making a decision of configuration of the improvements to the above mentioned project in such a way that the Florida Department of Transportation (FDOT) statewide minimum Level of Service (LOS) standards and Orange and Lake County standards can be achieved.

Traffic elements of this PD&E study such as existing and projected traffic volumes, trip distribution and assignment, and roadway LOS for the alternatives under consideration are presented in this Technical Memorandum.

The traffic analysis contained in this report includes some information from the “Wellness Way Toll Road Sketch Traffic and Revenue Study” Final Report August 2013 by C&M Associates (C&M2013).

Figure 1-1. Project Study Area and Existing Roadway Network

2 Existing Year Traffic Conditions

C&M reviewed existing available information, performed field observations to obtain traffic characteristics of the area, and complemented the available information with information provided by AVCON, Inc.

2.1 Existing Roadway Configuration

New Independence Parkway extends from Avalon Road to a diamond interchange providing access to SR 429. The project is proposed to extend this roadway westward to connect to US 27. New Independence Parkway is currently a two-lane, two-way roadway connecting to Avalon Road and a four-lane divided roadway in the vicinity of the SR 429 interchange. New Independence Parkway is under construction to connect eastward to Ficquette Road through the community of Independence.

US 27 is a four-lane divided roadway in the vicinity of the proposed project between Boggy Marsh Road and Lake Louisa Road and a six-lane divided roadway between US 192 and Boggy Marsh Road and between Lake Louisa Road and SR 50. US 27 has interchanges at the SR 50 and US 192 intersections. Posted speed limit in the vicinity of the project is 55 miles per hour (mph).

Avalon Road extends from US 192 to SR 50 in a north-south direction. The roadway is a two-lane two-way roadway. Posted speed limit is 45 mph.

SR 429 - Daniel Webster Western Beltway is a four-lane divided, limited-access toll road. SR 429 extends from I-4 to US 441, and is maintained by CFEA in the vicinity of the Project between the Seidel Road interchange and US 441, and by Florida's Turnpike from I-4 to Seidel Road. There is an interchange at New Independence Parkway that would connect to the proposed project. Posted speed limit is 65 mph.

US 192 - West Irlo Bronson Memorial Highway extends from US 27 to SR A1A. It is a four-lane divided highway from US 27 to just west of the SR 429 interchange. It connects to US 27 and to SR 429 via interchanges. Posted speed limit in the study area is 55 mph.

Schofield Road is a two-lane, two-way paved road extending from Avalon Road to approximately one mile west of SR 429. An interchange is planned to connect Schofield Road to SR 429, approximately two miles south of the New Independence Parkway interchange. This road extends to the west as a dirt road, referred as Shell Pond Road, connecting to US 27 just south of the proposed connection of the project with US 27. (C&M 2013)

Figure 1-1 shows this roadway network as described above.

2.2 Existing Year Traffic

2.2.1 Existing Traffic Volumes

As part of the C&M 2013 report, traffic count data from the Florida Department of Transportation (FDOT) traffic online web page and from the traffic counts webpage of Orange County. Counts collected by the agencies in the period of 2002 through 2012 were obtained. Figure 2-1 shows the 2012 traffic volumes within the study area. Table 2-1 shows the traffic growth for the project area highways. Traffic volumes show effects of the 2008-09 recession with stabilization by 2010-11 and recovery trends by 2012. (C&M 2013)

Figure 2-1. Existing Traffic Volumes

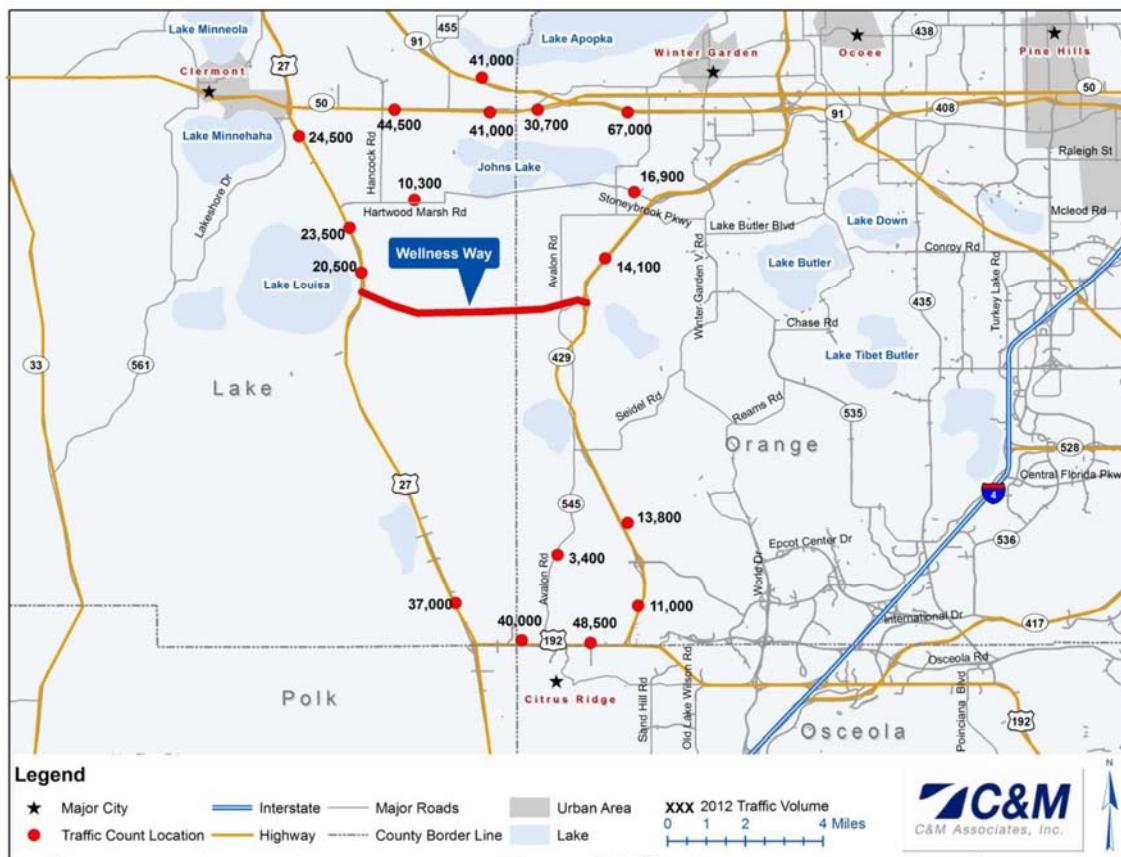

Table 2-1. Historical Traffic Volumes

Location	2002	2003	2004	2005	2006	2007	2008	2009	2010	2011	2012	
SR 50 East of Hancock	41,500	45,000	50,000	56,000	53,000	56,000	49,000	47,000	46,000	44,000	44,500

Stoneybrook											16,900	

2.3 Traffic Analysis Assumptions

2.3.1 Methodology

The 2040 Orlando Urban Area Transportation Study (OUATS) model was utilized to forecast 2017 and 2037 travel demand. The OUATS model geographic area covers the MetroPlan Orlando Counties of Orange, Osceola and Seminole, in addition to the western portion of Volusia County, the Lake County network and northeastern portion of the Polk County network.

The OUATS travel demand model includes special trip purposes for the Orlando area special attractions such as Walt Disney World, Universal Studios, Sea World, Orlando International Airport, the Orange County Convention Center and others. The project may provide an alternate route to these special traffic generators for communities in the vicinity of the project. The model was developed in 2011 and is based on land use approved by MetroPlan Orlando. It should be noted that MetroPlan Orlando adopted the 2040 plan and model in 2014 based on a land use trends plan and an alternative land use plan identified during the planning process.

The original C&M study utilized the 2030 OUATS model which didn't show growth out to 2037 or the Wellness Way Sector Plan, which the 2040 model does.

2.3.2 Traffic Factors

The peak hour ("K") and directional ("D") factors are used to convert the Annual Average Daily Traffic (AADT) to peak hour directional volumes.

The K-factor is the ratio of the hourly two-way traffic to the two-way AADT. The K₃₀ is the relationship between the 30th highest hourly volume of the year and the AADT for the design year. The K₃₀ is used to determine the design hour volume (DHV).

The directional distribution factor (D-factor) is the percentage of the total, two-way peak hour traffic traveling in the peak direction. D₃₀ is the proportion of traffic in the 30th highest hour of the design year traveling in the peak direction. The directional distribution is an essential parameter used to determine the directional design hour volume (DDHV). The DDHV is the basis of geometric design.

The truck factor (T₂₄ or simply T) is critical for an accurate roadway pavement design. T is the percentage of trucks using a roadway for 24 hours.

The actual composition of trucks is needed for operational analysis and noise studies. In addition to the T factors already defined, the following definitions are also needed:

Design Hour Truck (DHT): The percentage of trucks expected to use a highway segment during the 30th highest hour of the design year. The adjusted, annual design hour percentage of trucks and buses (24T+B or T₂₄) divided by two.

DH2: The adjusted, annual design hour medium truck percentage. It is the sum of the annual percentages of Categories 4 and 5 (Figure 2.2 of the FDOT's Project Traffic Handbook), adjusted to 24 hours, and divided by two.

DH3: The adjusted, annual design hour heavy truck percentage. It is DHT minus DH2, or the sum of the adjusted annual percentages of Categories 6 through 13 (Figure 2.2 in the FDOT's Project Traffic Handbook), divided by two.

The FDOT traffic count stations provided the traffic factors for the study area. Table 2-1 shows the selected traffic factors based on the analysis of the FDOT database and the recommendations stated in FDOT's "Project Traffic Forecasting Handbook".

Table 2-2. Traffic Factors

	US 27	SR 429	New Independence Parkway	Wellness Way
K ₃₀	9.00	10.50	9.00	10.50
D ₃₀	54.70	53.30	53.30	53.30
T ₂₄	11.90	12.70	4.10	4.10
T _{Design}	5.95	6.35	2.05	2.05
FDOT Site ID	11-0007	75-0670	75-8202	N/A

Based on the preceding discussion, it is reasonable to accept the counts obtained for this project as the base traffic, since they are a true reflection of the situation on the ground. At the same time, the preceding assessment also allows for the acceptance of the travel demand model outputs for the future year traffic within the study area.

3 Future Years Traffic Conditions

3.1 Traffic Analysis Assumptions

3.1.1 Methodology

Future year traffic was developed for the opening year and the design year. It was determined within the Scope of Services for this project that the year 2017 will be the opening year. FDOT guidelines (Project Traffic Forecasting Handbook, FDOT - 2002) establishes a 20-year period for the design year forecast after the opening year, making the design year 2037.

3.1.2 Traffic Factors

The same traffic factors developed for the existing year were used in all future years. The uncertainties linked to the future land use along the corridor, and the use of area-wide average of parameters, made this determination reasonable. It was also in agreement with FDOT guidelines, which are centered on an accurate estimate of K₃₀, D₃₀, and T for the current roadway system because it will provide a reasonable estimate of them for the design year. It also makes the comparison of different alternatives easier by giving all of them the same traffic factors.

3.1.3 Daily Traffic Volumes

The new Wellness Way is proposed to be a toll facility. For the purposes of this report and analysis, only the minimum toll value of \$0.75 was used as this will produce the highest volume of traffic and will allow for the analysis of the “worst case” scenario for traffic operations.

Wellness Way would provide a direct route from east of SR 429 to US 27 which could alleviate congestion on SR 50 from US 27 to SR 429 and on SR 429 from SR 50 to Wellness Way. By providing east/west access from SR 429 to US 27 this route will also provide more route choices to Disney parks and properties from US 27 north of Wellness Way via the interchange at SR 429.

Familiarity with the road and the travel time benefits would increase the use of the facility. Table 3-3 shows the No-Build and Build AADTs for the project for 2017 and 2037.

Table 3-1: 2017 & 2037 AADTs

Facility	Location	No-Build Year 2017 AADT	Build Year 2017 AADT	No-Build Year 2037 AADT	Build Year 2037 AADT
US 27	North of Wellness Way	52,900	52,400	58,100	64,900
US 27	South of Wellness Way	52,900	53,400	58,100	70,678
Avalon Road	North of New Independence Parkway	N/A	19,200	N/A	26,500
Avalon Road	South of New Independence Parkway	N/A	17,000	N/A	33,100
New Independence Parkway	East of SR 429	4,800	4,300	19,200	16,895
New Independence Parkway	West of SR 429	800	1,800	3,000	11,600
Five Mile Road	North of Wellness Way	N/A	0	N/A	400
Wellness Way (4L/6L)	Between Avalon Road and Five Mile Road	N/A	21,000	N/A	42,100
Wellness Way (4L/6L)	Between Five Mile Road and US 27	N/A	21,000	N/A	42,100
Wellness Way (4L/6L)	Between Avalon Road and SR 429	N/A	1,800	N/A	11,600

3.2 Directional Design Hour Traffic Volumes

Capacity and operational analysis for the intersections required the determination of DDHV. DDHV is the traffic volume expected to use a highway segment during the peak hour of the design year (2037) in the peak direction. Opening year (2017) directional peak hour volumes were also developed to allow the possible use of this analysis in a phased construction of the project if so desired, and to establish no-build conditions.

The methodology that was used for this analysis is consistent with the FDOT's Project Traffic Forecasting Handbook. FDOT's TURNS5A Turning Analysis Tool is the recommended program for balancing turning movements and therefore was the method chosen to develop DDHV. TURNS5A first balances the 2-Way AADT volumes to achieve consistent flow in and out of every approach, and then calculates the DDHV by applying the K and D factors to the 2-Way AADT volumes for each intersection being analyzed.

DDHVs were developed for both the AM and PM peak for the No-build and Build scenarios shown in Figures 3-1 and 3-2.

Figure 3-1 : DDHVs No-Build

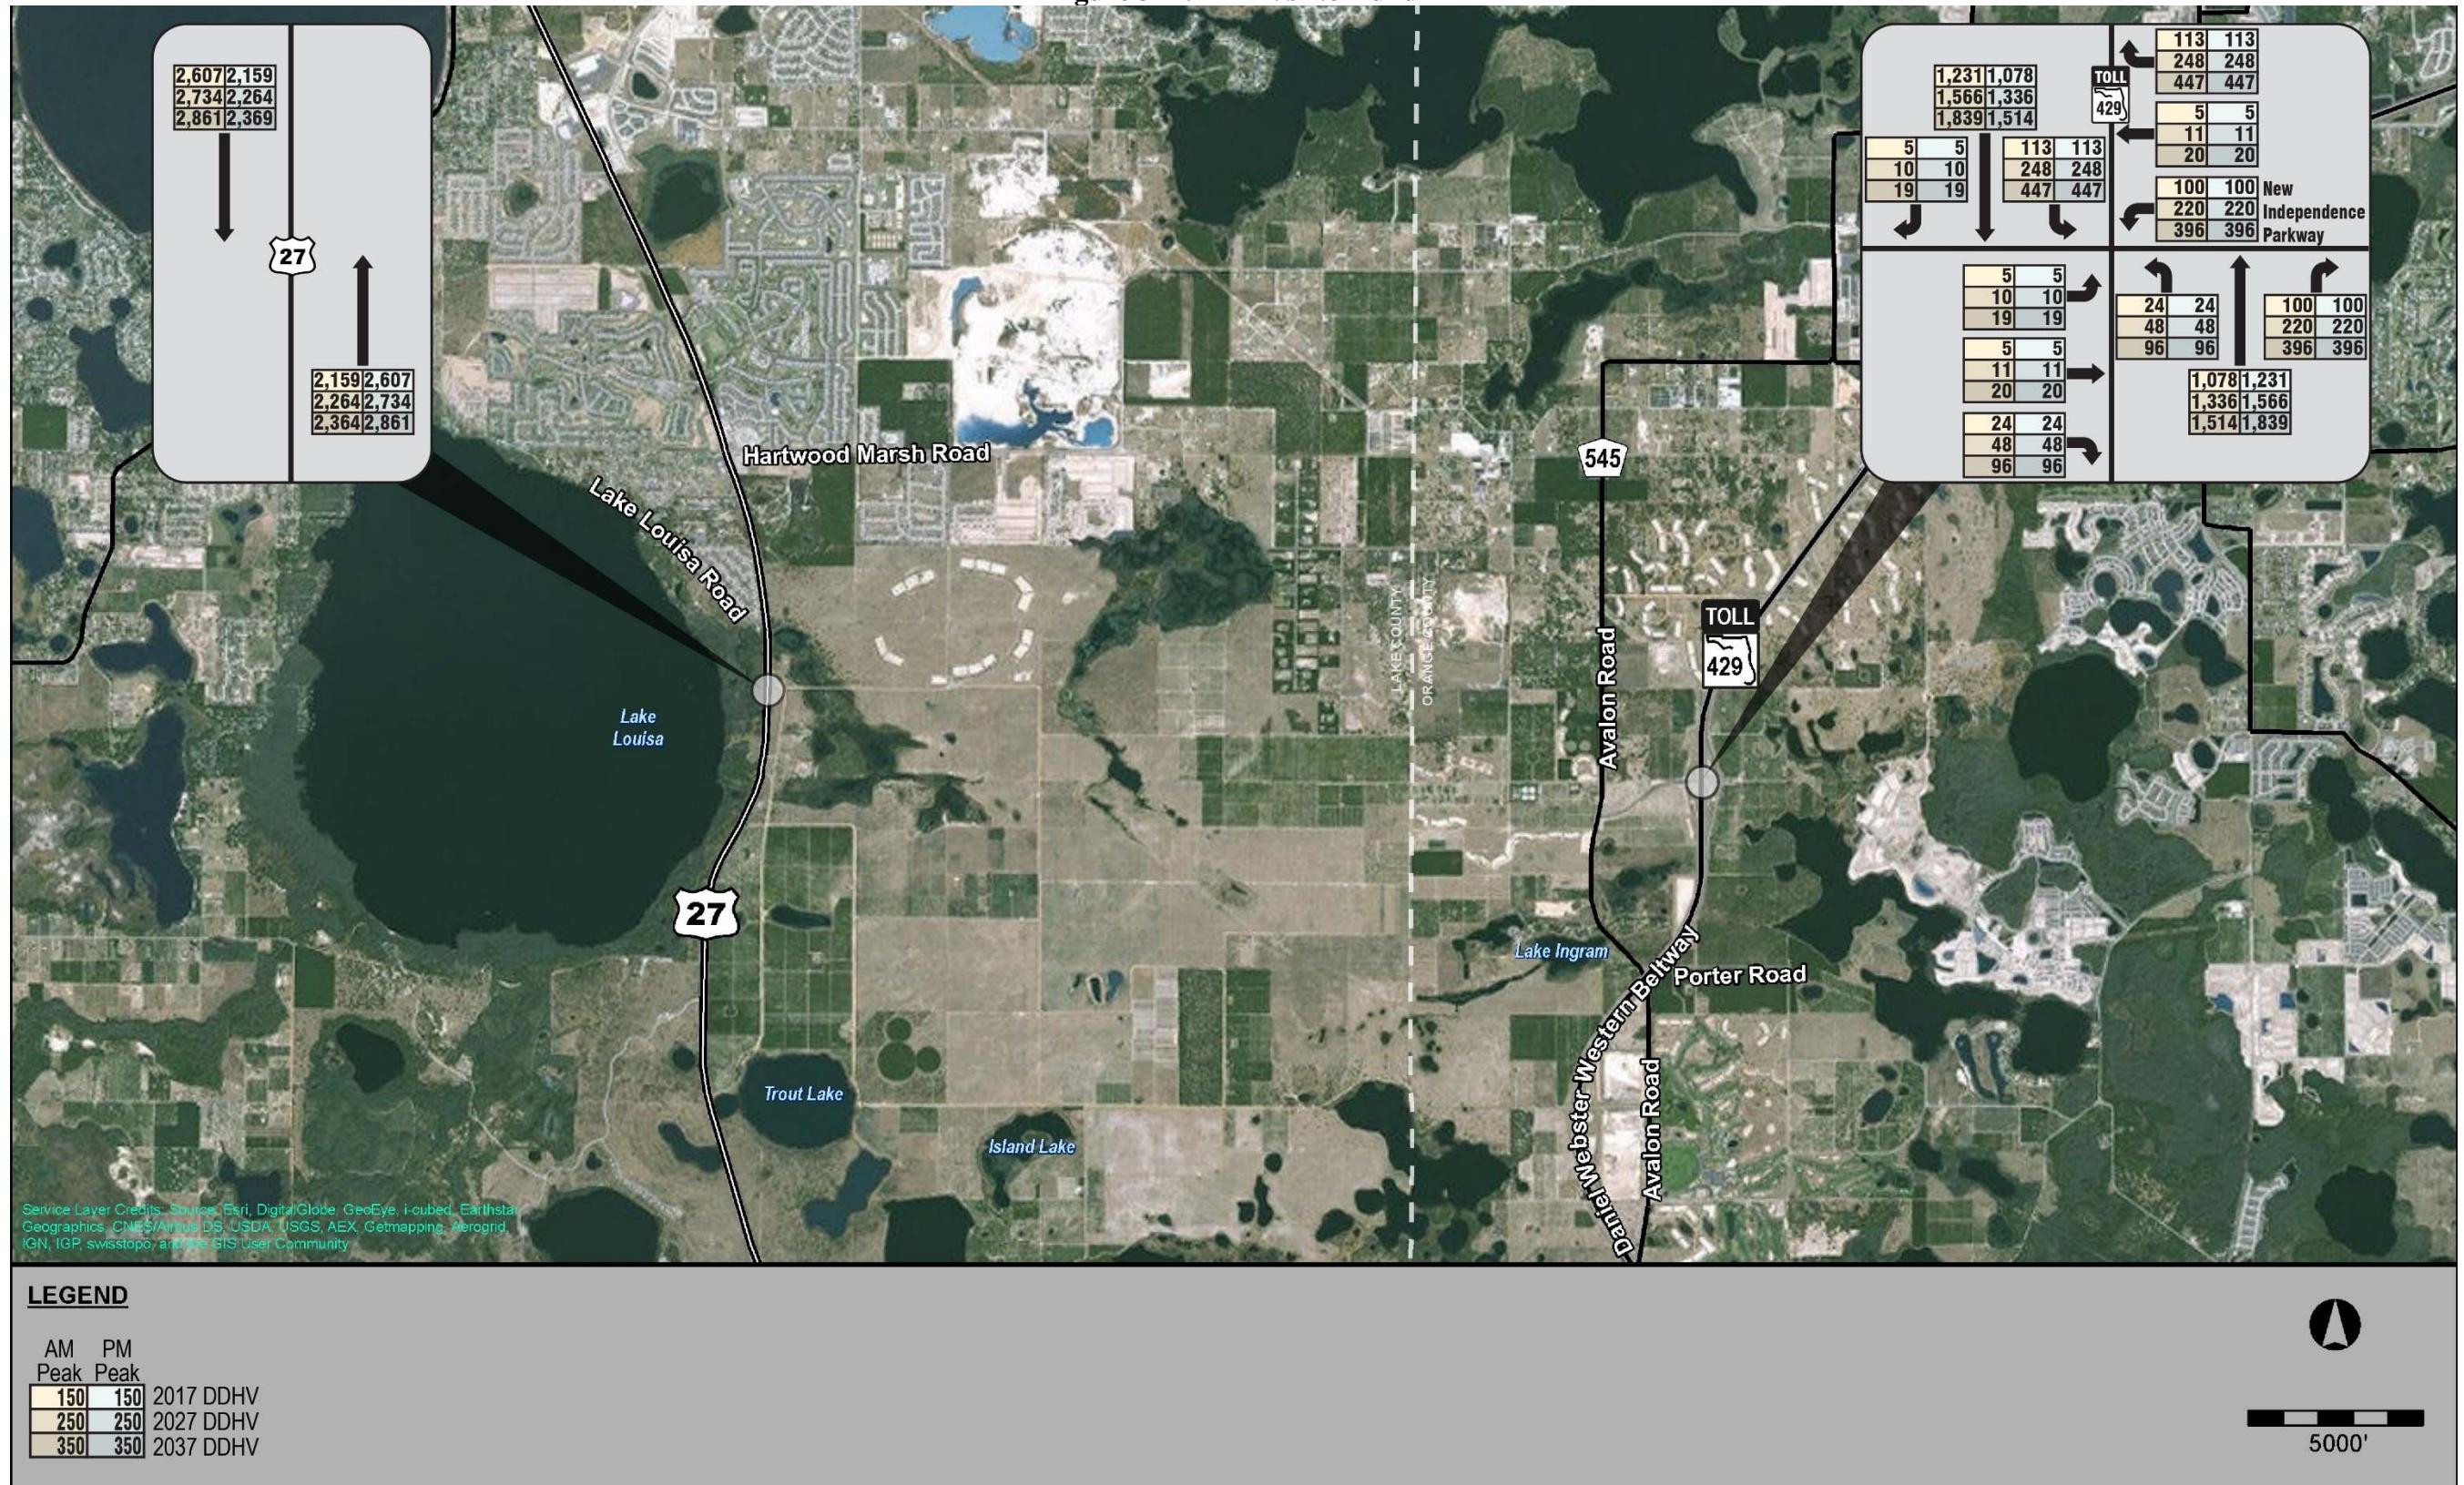

Figure 3-2: DDHVs for Building

4 Operational Analysis

LOS is based on a combination of the 2000 Highway Capacity Manual (HCM) and the 2010 HCM methodologies. This was necessary in order to develop some of the intersection level of service measurements. The 2010 HCM does not allow or provide LOS for certain lane groups, as such the 2000 HCM was used to develop the intersections LOS. The 2000 HCM output from Synchro software was used, as appropriate, to measure performance for the intersection traffic operational analysis. For ramp analyses, the latest version of the Highway Capacity Software was utilized. The operations analyses that were performed as part of this project are described in this section.

4.1 Existing and Future Years Daily Traffic Level of Service Analysis

The FDOT's Quality/Level of Service Handbook generalized tables were used in this analysis to evaluate the performance of the roadway segments. (*It should be noted that this method only provides a general indication and is not to be used for design where more detailed intersection analysis is required, and the generalized tables have assumptions that may not match the subject roadway(s).*) This analysis is used only for comparison of alternatives only.

A summary of this analysis is found in Table 4-1. The assumption for Wellness Way is the extension of Independence Parkway to the west. This extension will terminate at US 27, essentially creating an east-west connector between SR 429 and US 27. The new roadway is planned as a toll facility with electronic toll collection, and the old roadway will remain as it is now.

4.2 Hourly Traffic LOS Analysis

The hourly traffic or DDHV was evaluated using Generalized Tables from the FDOT's Quality/Level of Service Handbook. Table 4-2 shows the LOS results. (*It should be noted that this method only provides a general indication and is not to be used for design where more detailed intersection analysis is required, and the generalized tables have assumptions that may not match the subject roadway(s).*) This analysis is used only for comparison of alternatives only.

Table 4-1: 2017 & 2037 Daily LOS

Facility	Location	No-Build Year 2017 AADT LOS	Build Year 2017 AADT LOS	No-Build Year 2037 AADT LOS	Build Year 2037 AADT LOS

* FDOT Generalized Table 4 for Urbanized Areas - State Signalized Arterials modified by -10% for Non-State Roadway Adjustment for all roads except US 27 based on four-lane divided Wellness Way.

4.2.1 Existing Year (2013) LOS Analysis

The existing year (2013) Peak hour volumes were evaluated using the FDOT's LOS Generalized tables. Table 4-3 summarizes the LOS results for existing conditions.

The results indicate that the LOS at the study intersections is currently at or above the FDOT standard.

Table 4-3: 2013 LOS

Facility	Location	2013 Daily LOS*	2013 Peak Hr. LOS**
US 27	North of Shell Pond Road	B	B
US 27	South of Shell Pond Road	B	B
Avalon Road	North of New Independence Parkway	C	C

New Independence Parkway	East of SR 429	C	C
New Independence Parkway	West of SR 429	C	C

*Daily LOS = FDOT Generalized Table 1 for Urbanized Areas - State Signalized Arterials modified by -10% for Non-State Roadway Adjustment.

** Peak Hour LOS: FDOT Generalized Table 7 for Urbanized Areas - State Signalized Arterials modified by -10% for Non-State Roadway Adjustment.

4.3 Hourly Traffic LOS Analysis at Selected Intersections

The traffic analysis was conducted using Synchro traffic software which uses the HCM 2010 methodology to determine intersection LOS. Existing intersections within the corridor are currently unsignalized. Optimized signal timings were created using Synchro's optimization tool to achieve optimal intersection operating conditions and traffic progression for the Build conditions. The Synchro HCM intersection capacity analysis reports and Queuing and Blocking Reports are included in this report in Appendix B.

4.3.1 Future Year (Opening: 2017, Interim: 2027 and Design: 2037) Intersections LOS Analysis

Operational analyses were conducted on the selected intersections to determine their operational LOS for the No-Build and Build scenarios. This No-Build analysis utilized the existing roadway geometry and signal timings for the opening (2017), interim (2027) and design year (2037). The results of the No-Build analysis are summarized in Table 4-5.

The Build analysis utilized optimized signal timings and roadway geometry in order to provide acceptable operating conditions in the design year. Through the analysis it was determined the intersections at US 27/Wellness Way and Wellness Way/Avalon Road required more aggressive improvements. Figures 4-1 through 4-8 provide a schematic of these interchange concepts. Table 4-7 provides the results of the Build analysis.

Wellness Way & Avalon Road

Four alternatives were evaluated for the intersection of Wellness Way and Avalon Road:

- **Alternatives 1-1.3** – The first three alternatives utilize a traditional at-grade signalized intersection design. The lane configurations for alternatives 1-1.3 can be found in Table 4-6 below.
- **Alternative 2** – The signalized intersection alternative was analyzed with the addition of a flyover allowing a free flowing northbound left movement.

Table 4-4 Wellness Way & Avalon Road Approach Lanes Alternatives 1-1.3 & 2

Alternativ e	Approach Lanes											
	EBL	EBT	EBR	WBL	WBT	WBR	NBL	NBT	NBR	SBL	SBT	SBR
1	2	2	1	1	2	0	2	2	0	1	1	1
1.2	2	2	1	1	2	1	2	2	1	1	2	1
1.3	2	2	1	1	2	1	3	2	0	1	2	1
2	2	2	1	1	2	1	1*	1	1	1	1	1

*Grade separated and free flow movement.

US 27 & Wellness Way

The US 27 analysis evaluated the following four alternative intersection designs:

- **Alternative 1** – utilizes a traditional at-grade intersection layout with dual southbound and westbound left turn lanes, two northbound through and southbound through lanes as well as channelized northbound and westbound right turn lanes.
- **Alternative 1.2** – is the same geometry as Alternative 1 except an additional lane is added to the northbound through and southbound left approaches.
- **Alternative 2** – utilizes a flyover in order to allow a free-flowing southbound left turn movement.
- **Alternative 3** – was developed as an innovative design in order to allow the westbound left and southbound left movements to occur simultaneously which will lessen the impact on the northbound and southbound through movements on US 27. The alternative was created in order to avoid the construction of a flyover.

Figure 4-1: Wellness Way & Avalon Road – Alternative 1

4.3.2 Results Summary

The following section provides a summary of the traffic analysis of each of the tested alternatives. Table 4-7 lists the results of each build analysis and Appendix B contains the detailed HCS output.

SR 429 Interchange

The results of the Build analysis show that the SR 429 ramp termini will continue to operate at an acceptable level of service in the future with the introduction of traffic signals. Signal Warrant Studies will be required in order to install the signals.

Wellness Way & Avalon Road

The Alternative 1 design concept at Wellness Way and Avalon Road will continue to operate at LOS E through 2037. However, the minimum improvements to maintain an acceptable LOS E are represented by alternative 1.2. Alternative 1.2 improvements include northbound and westbound right turn lanes along with northbound dual left turns and the associated improvements to Avalon Road to accept eastbound dual lefts from Wellness Way. Alternative 1.3, which includes the improvements mentioned in alternative 1.2 as well as adding a third northbound left turn lane, performs at LOS D in 2037.

In order to further enhance the operation of this intersection, a northbound left turn flyover was analyzed. This improvement also allows the intersection to operate at LOS D through 2037.

Wellness Way & Five Mile Road

The Wellness Way/Five Mile Road intersection is expected to have light traffic volumes based on the development information utilized to develop the design traffic. It was not part of this analysis but was assumed to remain as a two-way stop controlled intersection through 2037. It should be noted that while the traffic is only projected to be 20 vehicles per hour in the southbound approach the approach LOS is expected to operate at LOS F in 2037. The introduction of a traffic signal or possibly a roundabout may eliminate operational deficiency. Further study would be required to determine the most appropriate form of traffic control.

Wellness Way & US 27

The intersection of Wellness Way and US 27 was analyzed as an at-grade intersection as well as two other alternatives including a flyover and a quadrant style signalized intersection. The intersection geometry shown in Alternative 1 (Figure 4-5) results in a LOS F in the opening year and continues to operate as an LOS F through 2037. The analysis of the at-grade intersection at this location was an iterative process. Short of widening US 27 and Wellness Way, none of the at-grade alternatives (alternatives 1 or 1.2) achieved an acceptable LOS. The addition of the southbound left-turn flyover provided a LOS D through 2037. The third alternative (quadrant by-pass) performed at an acceptable LOS until design year 2027 but failed in the PM in 2037.

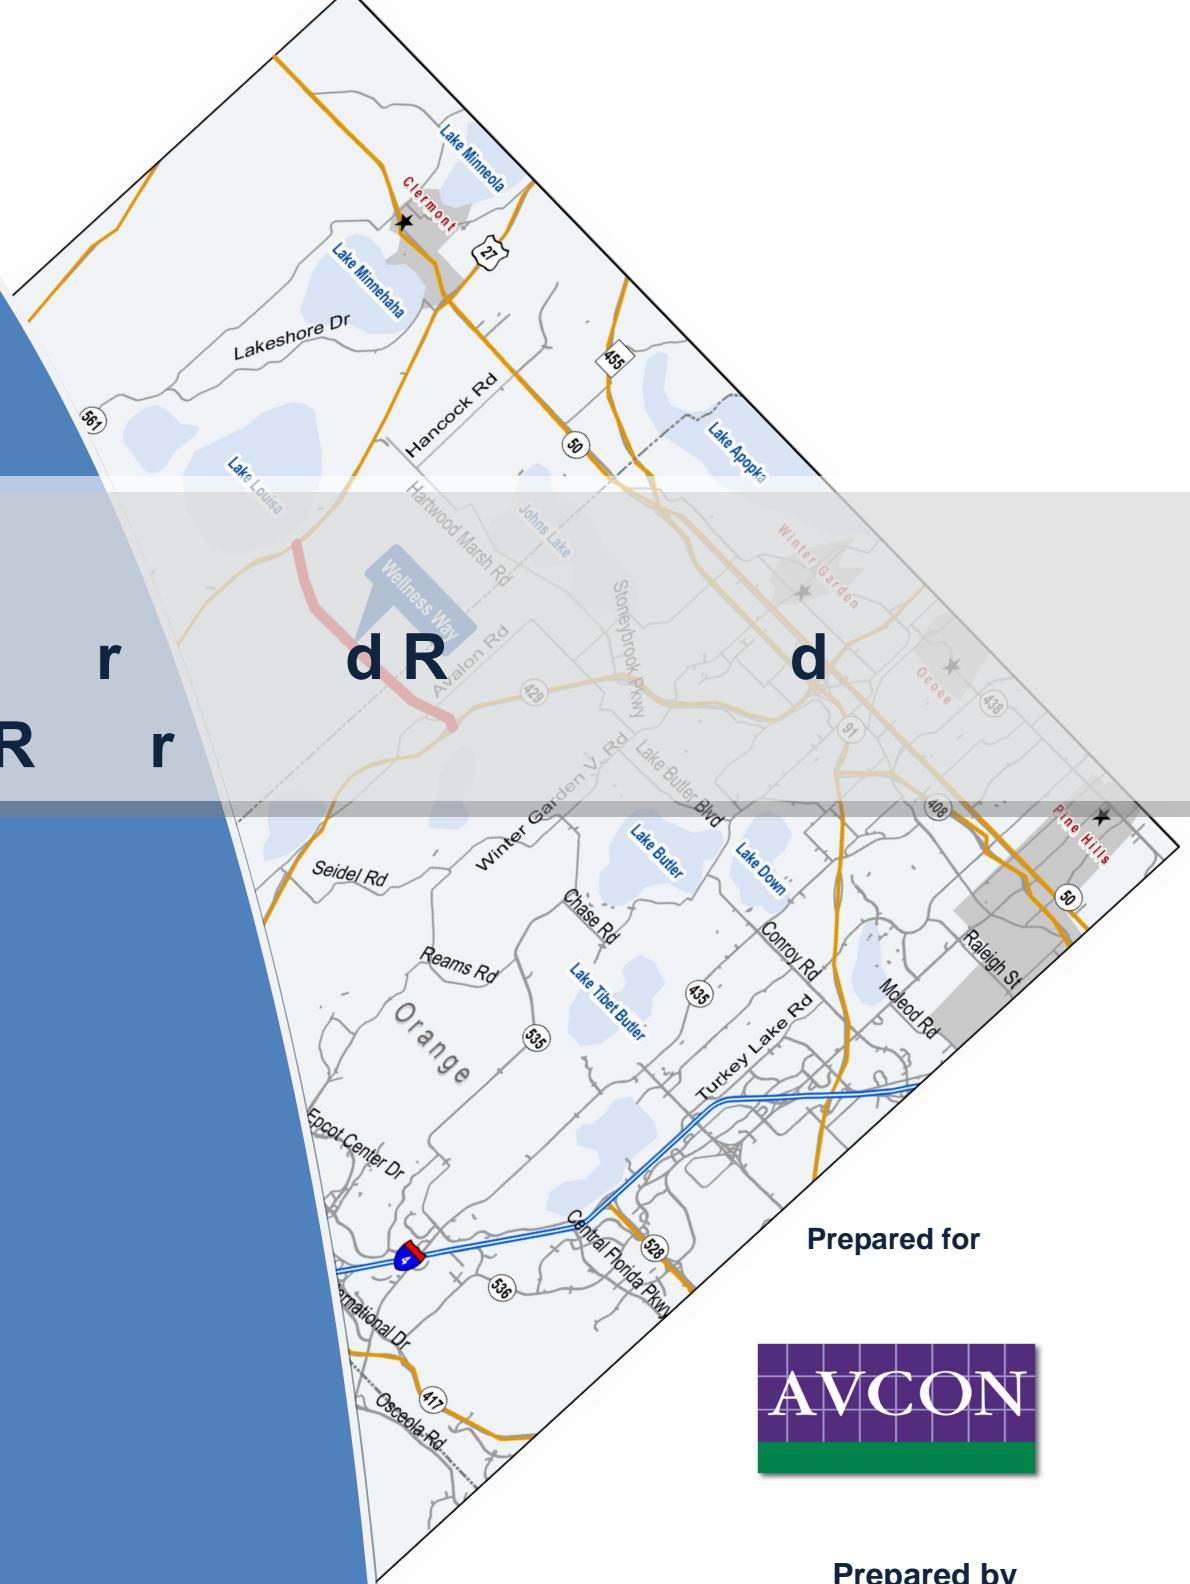

Table 4-5 Opening, Interim, and Design Year Intersection LOS (Build Scenario)

Intersection		LOS (Delay, seconds)					
		2017		2027		2037	
		AM	PM	AM	PM	AM	PM
New Independence Pkwy at NB SR 429 Ramp		C (23.6)	C (23.6)	C (34.3)	C (34.3)	D (40.9)	D (40.9)

Subject: Wellness Way
Level 1 Traffic and Revenue Study
Final Report

C&M Associates, Inc. is pleased to provide you with the Final Report of the Level 1 - Sketch Traffic and Revenue Study for Orchard Pond Road. This report presents an overview of the proposed project, an assessment of existing traffic conditions, available traffic data and potential traffic demand from the local model for the study area. The report presents the methodology and approach for travel demand forecasts, review of traffic operations, analysis of toll diversion and most importantly, the traffic and revenue forecast.

The C&M team including, Shahram Bohluli, Carlos M. Contreras, Carlos Miranda, Sara Sohaee and Sruti Marepally expresses its sincere gratitude to AVCON, Inc. and Clary Consulting LLC for providing the opportunity to participate in this project.

Respectfully,

A handwritten signature in black ink, appearing to read "Herbert E. Vargas".

Wellness Way Toll Road

Sketch Traffic and Revenue Study

FINAL REPORT

Prepared for

AVCON, Inc.

By

August 2013

The results of this study constitute the opinion of C&M. This opinion is based on normal professional effort with respect to future Traffic and Revenue for the tolled facility, subject to the time and budget constraints of the study's scope of work, and based on the information available to C&M at the time of execution of this study. C&M cannot guarantee or assure future events in connection to this Traffic and Revenue forecast.

1. Introduction

This report summarizes the inputs, assumptions and results of a Sketch Traffic and Revenue (T&R) study for the Wellness Way Toll Road project (“the Project”) in Orange and Lake Counties west of Orlando, Florida, from US 27 to the interchange of SR 429 and New Independence Parkway. The work was undertaken by C&M Associates, Inc. (C&M) through AVCON, Inc.

1.1 *Study Goals and Objectives*

The primary goal of this study is to prepare a Sketch T&R forecast for the Project to evaluate its preliminary financial feasibility. The study focuses on an alignment previously selected by a study undertaken by Orlando Orange County Expressway Authority (OOCEA) and referred as Alternative "D" as an extension of New Independence Parkway.

As part of the study, C&M performed the following:

- Prepared a study that is consequent with the previous history of the Project;
- Included all contextual information relevant to the Project, including updates to the regional travel demand model;
- Analyzed the importance of the Project as a connection for development between US 27 and SR 429 corridors;
- Reviewed existing information for its reasonableness, including socioeconomic data, traffic data, and existing traffic demand models for the region;
- Accounted for project location in an area with a history of toll roads and high electronic toll transponders penetration;
- Utilized current state-of-the-art methodologies for the analyses; and
- Produced a T&R forecast.

1.2 *Wellness Way Toll Road Project*

The Project is proposed as an east-west roadway connecting US 27 to SR 429. Figure 1 provides a map of the project site location and the proposed alignment. The roadway is located in portions of southwest Orange County and southeast Lake County. The study focused on these two areas within the context of the overall Orlando metro area.

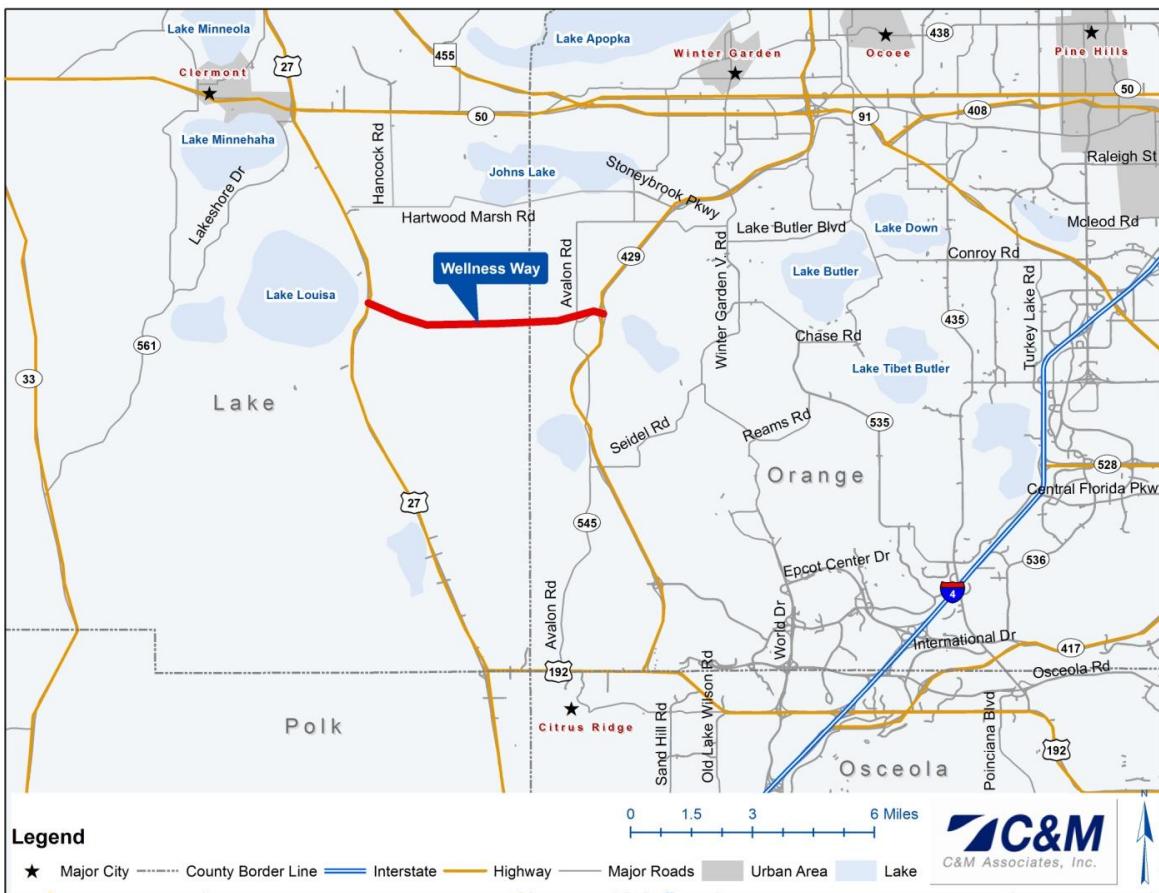

Figure 1– Project Location

Orlando Orange County Expressway Authority (OOCEA) issued a Concept Development and Evaluation Study for a SR 429 to US 27 Connector in January 2007. After evaluation of four prospective corridors, the study recommended the alignment of the proposed Project as meeting the study objectives of environmental protection and community building.

The main east-west arterial highways in the study area are SR 50, also referred as Broad Street in Lake County and Colonial Drive in Orange County, and US 192, also referred as W Irlo Bronson Memorial Highway. It should be noted that the segment of US 192 between US 27 and SR 429 is the boundary between Lake, Orange, Polk and Osceola Counties. The distance along US 27 between US 192 and SR 50 is approximately 15 miles. The only other east-west roadway connecting US 27 and SR 429 is Hartwood Marsh Road, which is approximately three miles south of SR 50. The Project, as proposed, will be approximately six miles south of SR 50. The Project falls under the Lake-Sumter Metropolitan Planning Organization for the segment in Lake County.

2. Existing Conditions

C&M reviewed existing available information, performed field observations to obtain traffic characteristics of the area, and complemented the available information with information provided by AVCON, Inc.

2.1 Existing Highway System

New Independence Parkway extends from Avalon Road to a diamond interchange providing access to SR 429. The Project is proposed to extend this roadway westward to connect to US 27. New Independence Parkway is currently a two-lane, two-way roadway connecting to Avalon Road and a four-lane divided roadway in the vicinity of the SR 429 interchange. New Independence Parkway is under construction to connect eastward to Ficquette Road through the community of Independence.

US 27 is a four-lane divided roadway in the vicinity of the proposed project between Boggy Marsh Road and Lake Louisa Road and a six-lane divided roadway between US 192 and Boggy Marsh Road and between Lake Louisa Road and SR 50. US 27 has interchanges at the SR 50 and US 192 intersections. Posted speed limit in the vicinity of the Project is 55 miles per hour (mph).

Avalon Road extends from US 192 to SR 50 in a north-south direction. The roadway is a two-lane two-way roadway. Posted speed limit is 45 mph.

SR 429 - *Daniel Webster Western Beltway* is a four-lane divided, limited-access toll road. SR 429 extends from I-4 to US 441, and is maintained by OOCEA in the vicinity of the Project between the Seidel Road interchange and US 441 and by Florida's Turnpike from I-4 to Seidel Road. There is an interchange at New Independence Parkway that would connect to the proposed Project. Posted speed limit is 65 mph.

US 192 - *W. Irlo Bronson Memorial Highway* extends from US 27 to SR A1A. It is a four-lane divided highway from US 27 to just west of the SR 429 interchange. It connects to US 27 and to SR 429 via interchanges. Posted speed limit in the study area is 55 mph.

Schofield Road is a two-lane, two-way paved road extending from Avalon Road to approximately one mile west of SR 429. An interchange is planned to connect Schofield Road to SR 429, approximately two miles south of the New Independence Parkway interchange. This road extends to the west as a dirt road, referred as Shell Pond Road, connecting to US 27 just south of the proposed connection of the Project with US 27.

Hartwood Marsh Road is a two-lane, two-way road extending from US 27 to Avalon Road, and then continuing east as Marsh Road and then as four-lane divided Stoneybrook West Parkway and as frontage roads to SR 429 connecting to the interchange at County Road 535 Winter Garden Vineland Road. Posted speed limit is 40 mph.

SR 50 - Colonial Drive/Broad Street extends from US 19 in Weeki Wachee near the Gulf of Mexico to US 1 in Titusville near the Intracoastal Waterway. It is a six-lane divided highway within the study area with interchanges at US 27 and SR 91 or Florida's Turnpike. Posted speed limit within the study area is 45 mph.

SR 91 - Florida's Turnpike extends from the Golden Glades interchange (I-95, SR 826 and SR 91 interchange) in Miami-Dade County to I-75 in Wildwood, Sumter County. It is a toll road, providing regional connectivity with interchanges with SR 429, SR 408, I-4 and SR 528 in the vicinity of the study area. The Florida's Turnpike is a four lane divided highway north of SR 50 and an eight lane divided highway south of SR 50. Posted speed limit is 60 mph.

2.2 Traffic Volumes

C&M obtained traffic count data from the Florida Department of Transportation (FDOT) traffic online web page and from the traffic counts webpage of Orange County. The counts were collected by the agencies in the period of 2002 through 2012. Figure 2 shows the 2012 traffic volumes within the study area. Table 1 shows the traffic growth for the project area highways. Traffic volumes show effects of the 2008-09 recession with stabilization by 2010-11 and recovery trends by 2012.

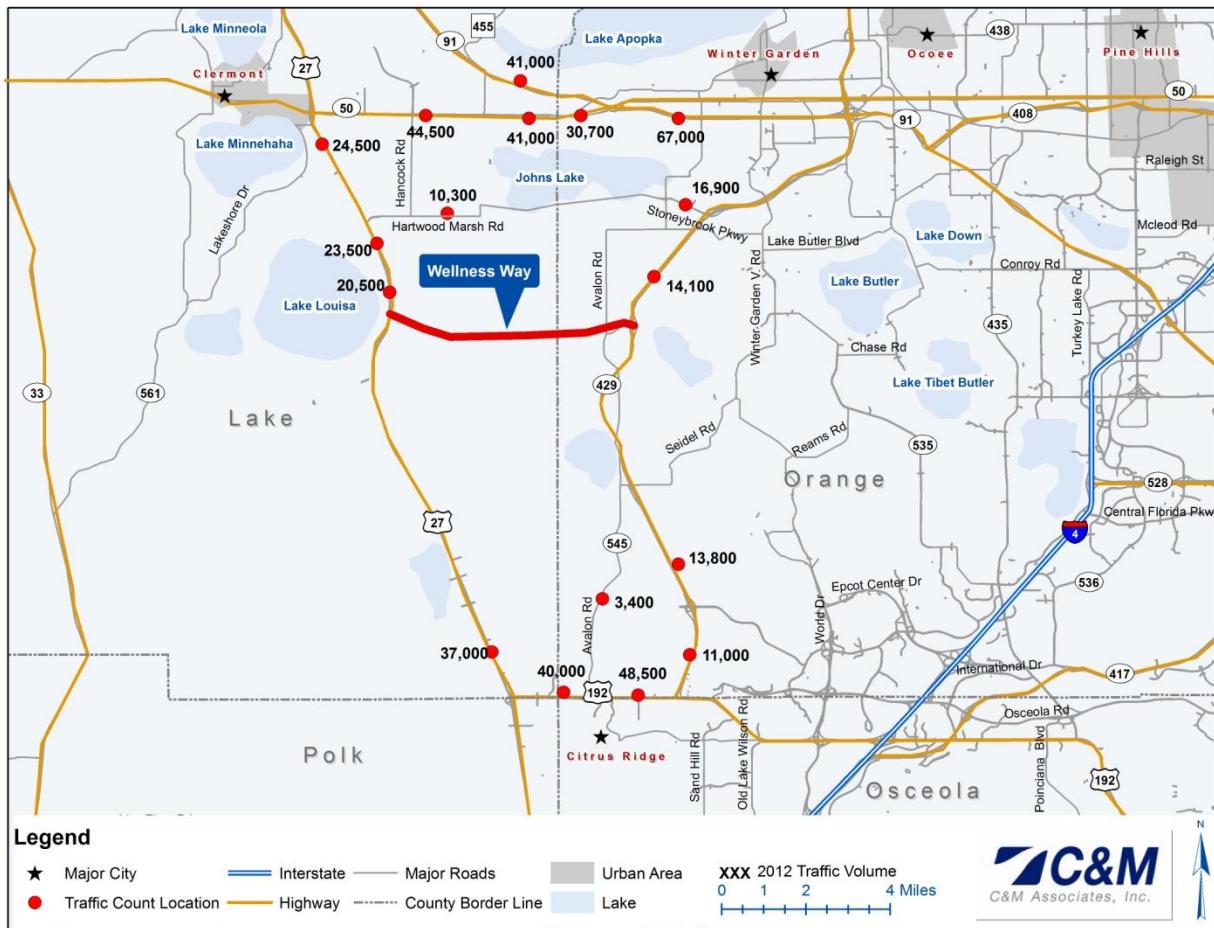

Figure 2– Existing Traffic Volumes

Table 1- Historical Traffic Volumes

Location	2002	2003	2004	2005	2006	2007	2008	2009	2010	2011	2012	
SR 50 East of Hancock	41,500	45,000	50,000	56,000	53,000	56,000	49,000	47,000	46,000	44,000	44,500

Avalon Road											3,400	
Hartwood Marsh											12,300	10,300
Stoneybrook												16,900

3. Travel Demand Estimation

3.1 Travel Demand Model

Sketch studies utilize existing available information to project forecasts. For purposes of the Project, the 2030 Orlando Urban Area Transportation Study (OUATS) model was utilized to forecast 2015 and 2030 travel demand. The OUATS model geographic area covers the MetroPlan Orlando Counties of Orange, Osceola and Seminole, in addition to the western portion of Volusia County, the Lake County network and northeastern portion of the Polk County network.

The OUATS travel demand model includes special trip purposes for the Orlando area special attractions such as Walt Disney World, Universal Studios, Sea World, Orlando International Airport, the Orange County Convention Center and others. The Project may provide an alternate route to these special traffic generators for communities in the vicinity of the project. The model was developed in 2004 and is based on land use approved by MetroPlan Orlando. It should be noted that MetroPlan Orlando adopted the 2030 plan and model in 2009 based on a land use trends plan and an alternative land use plan identified during the planning process.

C&M did not verify or validate land use assumptions throughout the region. However, cursory analysis of the traffic analysis zones within the Wellness project area indicates that the Horizons West development is assumed to be partially developed by 2015 and potentially fully developed by 2030. Also, the land in the vicinity of the Project in Lake County appears to be assumed as agricultural land with one dwelling unit per 10 acres for both 2015 and 2030.

3.2 Wellness Way Toll Road Demand

The 2030 OUATS travel demand model does not include the Project or a similar alignment for 2015 or 2030. For purposes of the Sketch T&R study, the 2015 and 2030 model highway networks were modified to include the Project as a toll-free roadway to estimate overall demand. Figure 3 shows the travel demand model assignment for 2015 with and without the Project, and Figure 4 shows the 2030 travel demand with and without the Project.

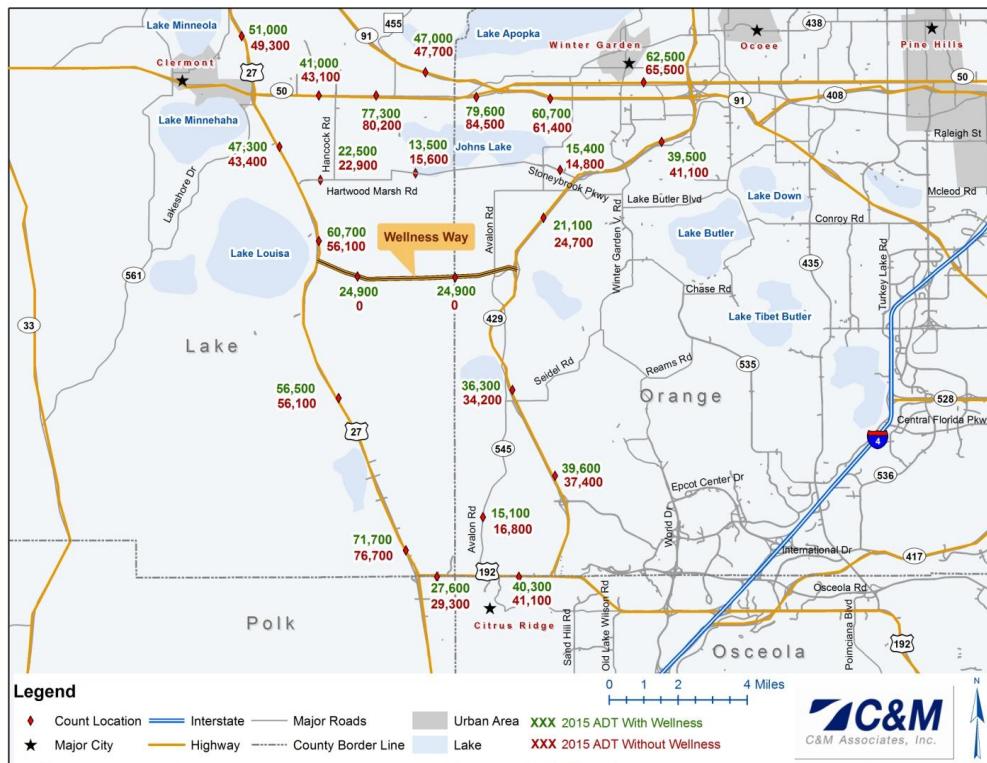

Figure 3- 2015 Travel Demand Model Volumes

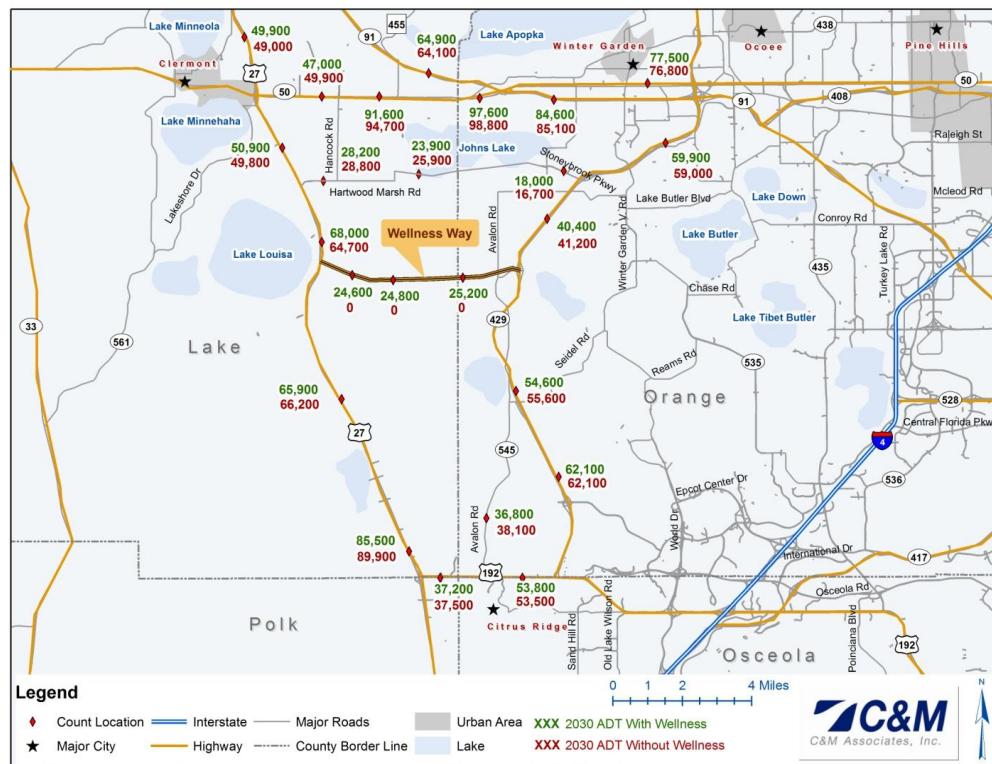

Figure 4- 2030 Travel Demand Model Volumes

Analysis of model traffic assignments indicated aggressive land use development for 2015. Essentially, the model is assuming a high rate of growth before 2015 and minor growth between 2015 and 2030. This is in contrary to the traffic trends in the area, where traffic volumes essentially peaked in 2006-2007, and bottomed in 2011 with a recovery beginning to show in 2012. For this reason, the analysis assumed a toll-free demand on the Project of 17,400 ADT for 2015 and 25,200 ADT for 2030.

3.3 Trip Distribution

For purposes of estimating capture rates once tolls are applied, it is important to understand the origin-destination of the trips and the potential route choices that drivers may have in the future. A select link analysis was conducted for the Project's trips. Figure 5 shows the traffic distribution for the Project's trips in the regional network for years 2015 and 2030. Based on this analysis, trips with an origin or destination in Horizons West account for approximately 13% of the Project's traffic by 2015 and approximately 40% by 2030.

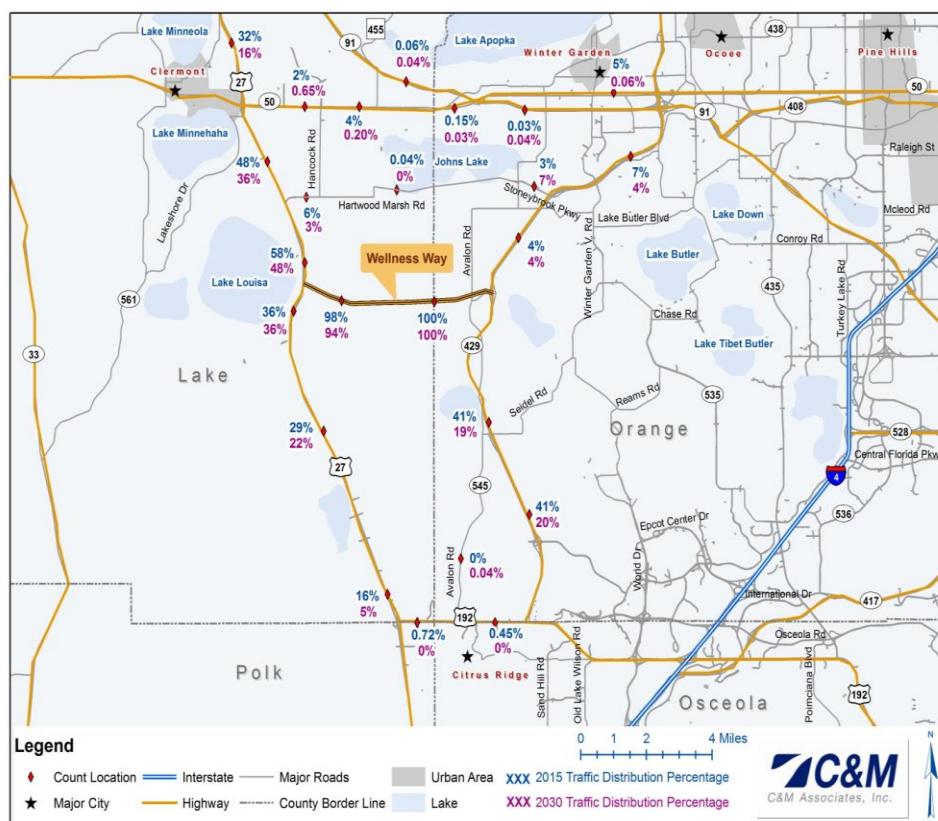

Figure 5- Wellness Way Toll Road Trip Distribution

Along US 27, the 2015 trip distribution indicates that 58% of the trips come from areas north of the proposed Project, while 36% come from areas south of the Project and 6% come from land uses adjacent to the Project. For 2030, trip distribution from the west indicates that 48% come from areas north of the Project, 36% from the south and 16% from land uses adjacent to it. Along SR 429, the 2015 trip distribution indicates that 41% of the trips go to/from the south and 4% to/from the north; while the 2030 trip distribution indicates that 19% go to/from the south and 4% to/from the north.

The above mentioned trip distributions indicate that in 2015, traffic utilizing the Project is primarily diverting from SR 50 and US 192 to arrive to their intended destinations with approximately 20% of the traffic having an origin or destination near the vicinity of the project. By 2030, as development increases at Horizons West and near the project, approximately 55% of the traffic will have an origin or destination in the vicinity of the project.

4. Traffic and Revenue Forecasts

4.1 Toll Diversion

The toll diversion model is based on the value of time of potential users of the facility and the travel time savings that the toll facility will offer to them. For purposes of a Sketch study, the methodology assumes that 100% of the travel demand for the "toll-free" alignment is eligible to utilize the future toll facility and then, based on potential time savings and value of time estimation, the methodology assumes a capture rate -- the percentage of vehicles that will utilize the tolled facility compared to the toll-free facility.

Metropolitan Orlando drivers as well as most Florida drivers are aware of toll roads and most of them are electronic transponder subscribers. The toll diversion methodology utilized for this project takes this fact into consideration. It should be noted that alternate routes to the proposed Project may include utilization of Florida's Turnpike or OOCEA toll roads.

4.2 Alternatives

Two alternatives were evaluated in this Sketch T&R study. One alternative assumes the construction of the Project as a two-lane two-way toll facility and a second alternative assumes the construction of the Project as a four lane divided facility. Both alternatives assume that a toll gantry will be built between Avalon Road and US 27 and that toll collection will be all electronic through the use of toll transponders and video tolling similar to the Florida's Turnpike.

4.3 Traffic and Revenue Assumptions

Toll diversion was calculated for each alternative based on calculated travel times with and without the Project. FDOT's Q/LOS Handbook shows a service capacity of 15,200 for two-lane two-way roads and 33,800 for four-lane divided highways. Level of service "C" daily volumes are shown as 14,100 for two-lane two-way and 32,100 for four-lane divided highways. These numbers are based on "K" value of 9.7% and "D" value of 0.55. However, toll roads tend to have higher "K" values and "D" values. For purposes of the Sketch analysis, the Project as a toll road is assumed to have a "K" value of 10.5 and "D" value of 0.63. Applying these values to the above numbers, the toll road level of service "C" capacity would be 11,400 for a two-lane two-way road and 25,900 for a four-lane divided roadway. In addition, a two-lane two-way road is adjusted depending on the percent of highway that may allow passing, and the percent of time that vehicles

may be following others. As toll roads "sell" value to motorists, the capacity for the two-lane two-way is adjusted by 20%, reducing its desirable capacity to 9,100 ADT. Travel time values are calculated based on this desirable capacity for purposes of the toll diversion calculation.

Adjustment factors were applied to the toll diversion results to account for a ramp up period, and for toll collection methods. The study assumes the Project open to the public by 2015 and provides a 30-year forecast for transactions and revenues. The design of the facility assumes all electronic toll collection compatible to the Florida's Turnpike facilities throughout the State of Florida. The study assumed a ramp up period of five years assuming a 65% electronic transponder market penetration by 2015 and increasing to 90% by 2020.

Revenue leakage for electronic transponder users is assumed at 1%. This rate accounts for misreads and times when the equipment may not work properly or not classify vehicles accordingly. Violation rates for video tolling are considered to range from 35% in the first year to 15% after the fifth year. This accounts for out-of-state license plates and/or delinquent payments.

The Project is not in the path of drivers utilizing the highway system. Currently most drivers utilize US 27 to access SR 50 or US 192. Others may utilize Hartwood Marsh Road to access SR 429. For this reason, during the first year of operation, it is assumed that only 50% of potential users of the Project will be aware the facility is a viable option for them. However, due to the familiarity of area drivers with toll roads, it is assumed that within five years the road will be accepted and recognized by the community.

The travel demand forecast and toll diversion is assumed on weekday average daily traffic. Trip lengths on Sundays tend to be more localized in nature for the majority of drivers. The study assumed the annual revenue generation to be equivalent to 325 times the weekday transactions and revenue for passenger cars and 280 times for trucks to account for weekends and holidays.

Truck traffic was assumed to be 3% of the daily traffic and tolls for trucks are estimated based on the number of axles. Truck toll charges are assumed to be the passenger vehicle rate times the number of axles minus one. Table 2 provides a summary of the T&R assumptions.

Table 2- Traffic and Revenue Assumptions

Item	Assumptions					
<i>Opening year of operations</i>	2015					
<i>Last forecasted year</i>	2044					
<i>Type of toll collection</i>	Electronic Toll Collection (ETC) and Video Tolling					
<i>Revenue Days</i>	325 days for passenger cars and 280 days for trucks					
	Year	Ramp up		Video	ETC Penetration	
		Auto	Truck	Violation	Auto	Truck
<i>Traffic Ramp-Up,</i>	2015	50%	50%	35%	65%	65%
<i>Video Violation and</i>	2016	60%	60%	30%	70%	70%
<i>ETC Penetration</i>	2017	70%	70%	25%	75%	75%
	2018	80%	80%	20%	80%	80%
	2019	90%	90%	15%	85%	85%
	2020	100%	100%	15%	90%	90%
<i>ETC Leakage</i>	1% of ETC Transactions					
<i>Truck Percentage</i>	3%					
<i>Average Truck Axles</i>	3.2					

4.4 Toll Sensitivity

The sensitivity analysis of the study assumed six toll rates fluctuating from \$0.50 per passenger car in each direction to \$3.00 per passenger car in each direction for each alternative. Figure 6 presents the toll sensitivity analysis for the two-lane two-way roadway. Based on this analysis, a toll rate of \$0.75 would provide the highest revenue for the facility. Figure 7 presents the toll sensitivity analysis for the four-lane divided road alternative. Based on this analysis, a toll rate of \$1.00 would provide the highest revenue for the facility.

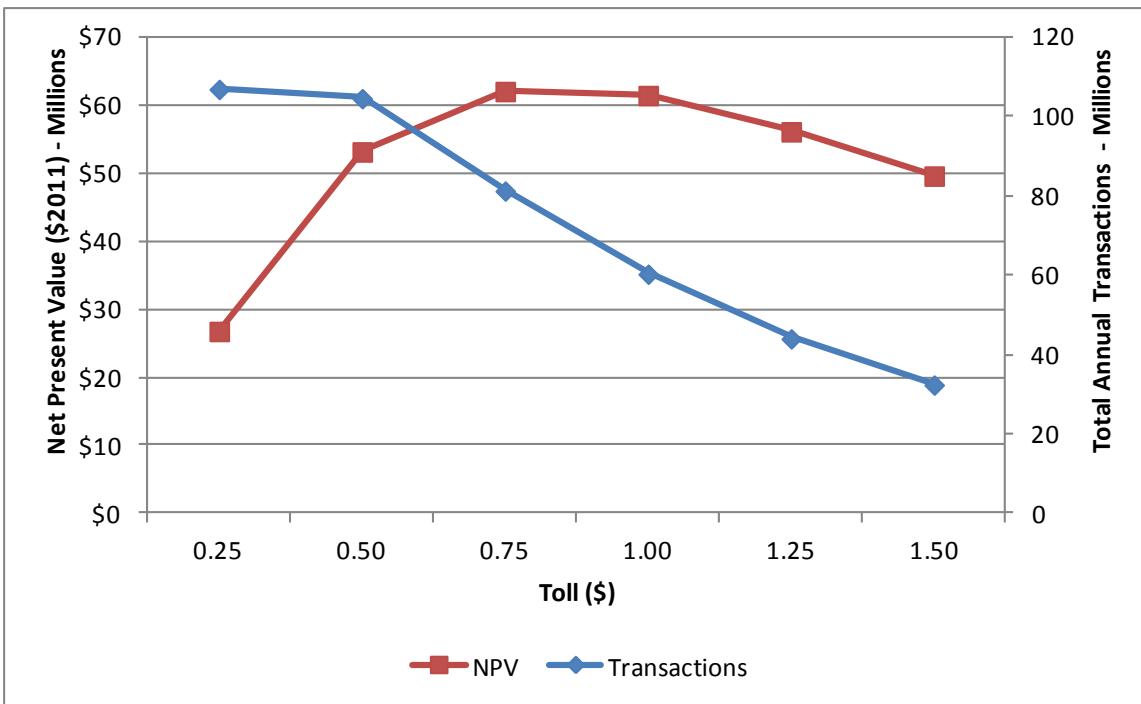

Figure 6- Toll Sensitivity for Two-Lane Two-Way Alternative

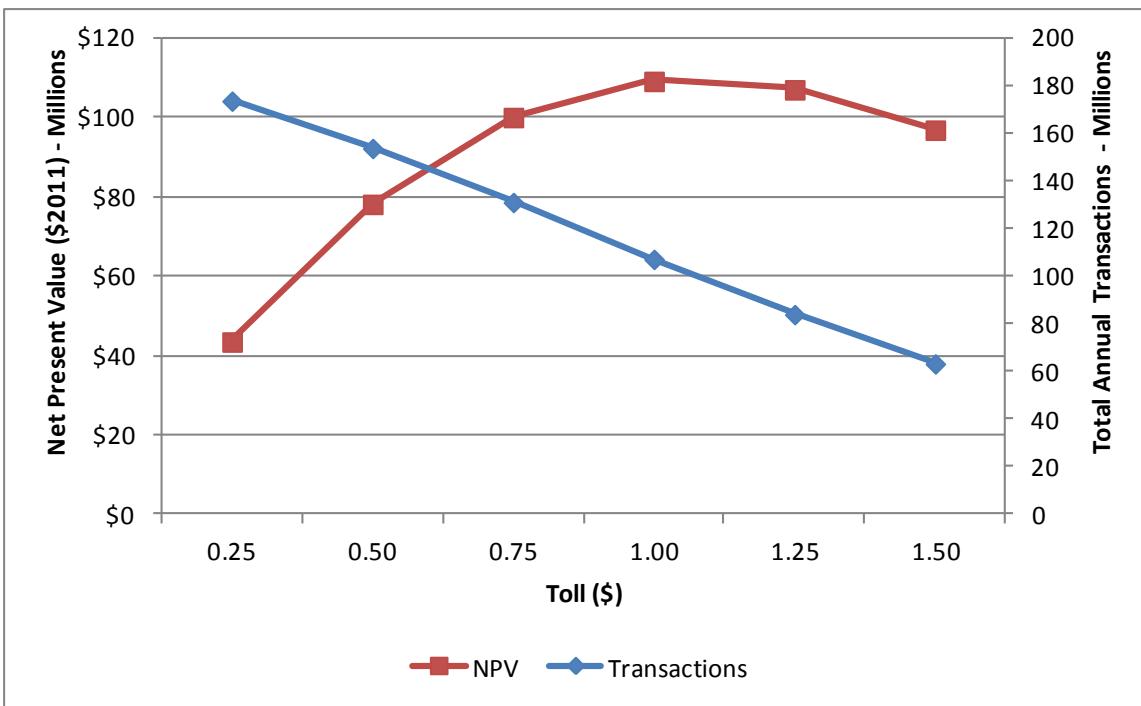

Figure 7- Toll Sensitivity for Four Lane Divided Alternative

4.5 Traffic and Revenue Forecasts

Table 3 presents the T&R forecast for the two-lane two-way toll road based on a \$0.75 toll rate.

Table 3- Traffic and Revenue Forecasts for Two-Lane Two-Way Alternative

Traffic and Revenue Forecasts based on toll rate of \$0.75

Year	Annual Transactions			Annual Revenue (Nominal Dollars)
